How to read this guide. Chapters 1 to 5 take you from a new account to your first analyses in Paper, in order. Then choose how you trade for real: chapter 7 (Real money, automatic on Binance) or chapter 8 (Manual mode, by hand on any exchange). No Binance account? Skip chapter 7.

Before you trade. ForecastsPro is software that runs the strategy you configure. Its analysis is AI-generated and can be wrong, nothing in it is financial advice, and crypto trading can lose money. Only trade money you can afford to lose.

CHAPTER 01

Welcome to ForecastsPro

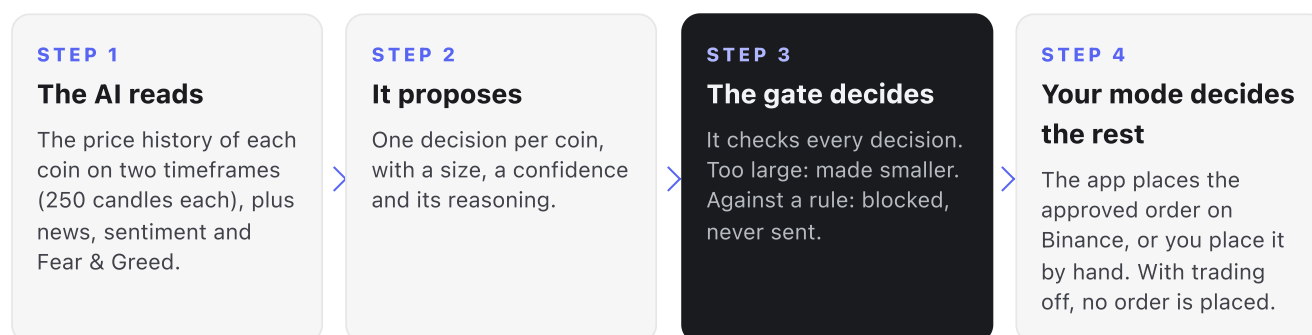

The AI proposes, limits written in code decide. Automatic on Binance, by hand on any exchange.

01

ForecastsPro splits trading into two jobs. The AI reads the market for every coin on your watchlist and proposes buy, sell or hold. Limits written in code then decide what is allowed. They are the risk gate, and the AI cannot change them.

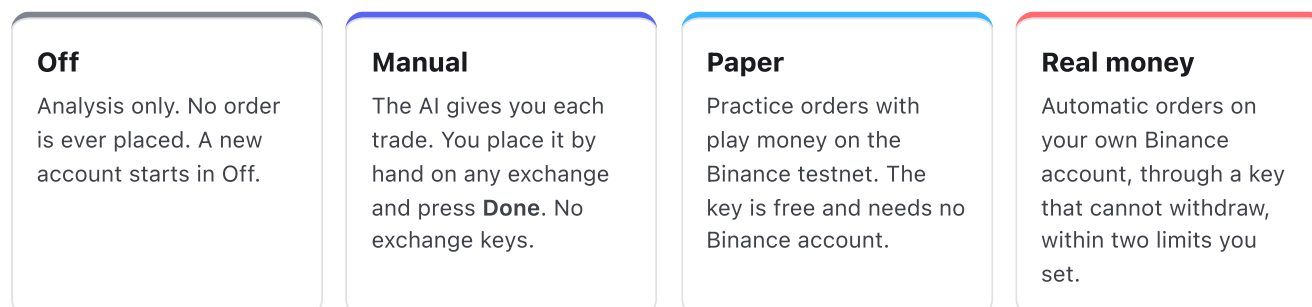

How one analysis works

Every analysis follows the same four steps.

Four trading modes

Automatic on Binance, by hand on any exchange.

Practice in Paper first. For real trades, choose Real money (chapter 7) or Manual mode (chapter 8).

What you need

The app follows coins that trade against USDT on Binance and uses Binance prices, whatever exchange you use. Your watchlist holds up to 30 coins.

- ☐ **Your ForecastsPro account** (chapter 3).
- ☐ **An AI API key** from Anthropic (recommended) or OpenAI, billed to you by that provider.
- ☐ **Exchange keys:** only for Paper and Real money, as the cards above say.
- ☐ **Optional:** news keys (CryptoPanic, X, Reddit) and Telegram for alerts.

Next: chapter 2 shows what protects you. To start at once, go to chapter 3.

Why ForecastsPro is built to be safe

Your money stays in your own account, your limits are written in code, and nothing trades until you switch a mode on.

02

Software that can trade with your money must be built with care. Here is every safeguard, the modes it works in, and what it cannot do.

Your money stays in your own account

This is true in every mode. ForecastsPro never holds your money.

Paper and Real money trade through an API key that you create. For Real money the app asks Binance what your key may do, and it accepts only a trade-only key. It refuses a key that can withdraw or transfer money, or trade margin, futures or options. It also refuses a key that is not restricted to our server IP address (chapter 7). It checks the key when you switch Real money on, before every real-money analysis and before every real order.

Saved keys are encrypted and never shown again. You can remove one on the **API keys** card at any time.

Manual mode needs no exchange keys: the app places no order and reads no balance.

A risk gate the AI cannot change

In every mode, each decision passes these rules:

- **Watchlist only.** A coin that is not on your watchlist is blocked.
- **Minimum confidence.** A decision under the minimum confidence of your risk level is blocked.
- **Per-coin cap.** No coin takes more than its share of your budget.
- **Total budget cap.** All positions together stay within your budget.
- **Sells only positions.** Only a position can be sold: a coin the app bought or, in Manual mode, a buy you confirmed.

A buy too large for a cap is made smaller. With no room left, it is blocked. Coins that were already in your account are never sold and never counted.

The three risk levels, exactly as coded

RULE	LOW	MEDIUM	HIGH
Per-coin cap (share of budget)	5%	15%	30%
Daily-loss limit (share of budget)	2%	5%	10%
Minimum confidence	0.70	0.60	0.50
Default stop-loss	3%	5%	10%
Default take-profit	6%	10%	20%

You pick a level, not each rule. Only stop-loss and take-profit can also be set on their own. A confidence of 0.70 is 70%.

The daily-loss kill switch

For each mode, the app adds up the profit and loss of the trades closed in the last 24 hours. When the loss is over your daily-loss limit, the kill switch pauses **new buys**. Buys start again when that loss is back under the limit. Sells, stop-loss and take-profit orders still go through. In Manual mode the kill switch counts the sales you confirm.

A stop-loss and take-profit after every buy

In Paper and Real money, the app places two sell orders on Binance after each buy. The take-profit sells when the price has risen by your take-profit percentage, the stop-loss when it has fallen by your stop-loss percentage. When one sells, Binance cancels the other. If Binance refuses the pair, the app tries again, and the dashboard warns in red (chapter 5).

In Manual mode each buy comes with both prices, and you set the two orders yourself.

Real money stays locked until the safety checks pass

Off, Manual mode and Paper are always available. Real money needs every safety check on the **Trading mode** card:

- ☐ Real money is open on the platform and allowed in your country.
- ☐ Your email is confirmed.
- ☐ You acknowledged the current Risk Disclosure.
- ☐ Your Binance key is trade-only and IP-restricted.

Each time you switch to Real money, you accept the disclaimer and set two limits: a maximum amount, and a loss lock that stops all trading (chapter 7). We recommend a separate Binance account for it, with only the money you are prepared to trade.

Everything is recorded

Your decision journal keeps every decision, in every mode, with its reasoning and the gate's verdict. You can download all of it. If Binance does not answer an order, the app looks the order up and does not send it again.

WHAT SAFETY CANNOT DO

The limits lower risk. They do not remove it. A stop-loss does not guarantee the exit price, and when the price jumps it may not sell at all. An exchange can be down or refuse an order. The budget limits the money at work, not what a falling market can cost. In Manual mode the limits count only the trades you confirm (chapter 8). The AI can be wrong, nothing here is advice, and you can lose money. Trade only money you can afford to lose.

Next: chapter 3, your account and your first sign-in.

Getting started

Your account, your email and your first look at the dashboard.

Four short steps, in order.

1 Create your account and pay

Open the checkout page at app.forecastspro.com/checkout. Fill in the form, tick the box and press the pay button.

The screenshot shows the checkout page for 'ForecastsPro, one year'. It includes sections for 'Your account' (Email, Password, Country of residence), 'Pay with' (USDT, BTC, ETH), an 'Agreement box' with terms and conditions, and a 'Pay now' button. Numbered callouts 1 through 7 highlight the following elements:

- 1: Email input field
- 2: Password input field
- 3: Country of residence dropdown menu
- 4: Pay with selection buttons (USDT, BTC, ETH)
- 5: Warning message about sending the exact amount
- 6: Agreement box with terms and conditions
- 7: Pay now button

#	NAME	WHAT IT DOES
1	Email	Your sign-in address. Your receipt, reminders and password resets go here.
2	Password	At least 10 characters. You sign in with it.
3	Country of residence	Where you live now. Only support can change it later.
4	Pay with	USDT on TRC-20 or ERC-20, BTC or ETH.
5	Network warning	Send exactly the coin and network shown. A payment on another network can be lost.
6	Agreement box	Accept the Terms and confirm you read the Risk Disclosure.
7	Pay	Creates your account and opens the secure OxProcessing payment page.

The checkout page (signed out).

On the payment page, send exactly the amount, coin and network it shows, within about 30 minutes. Your access starts once the network confirms the payment, usually within minutes, and your receipt arrives by email. Access runs for 365 days and never renews by itself.

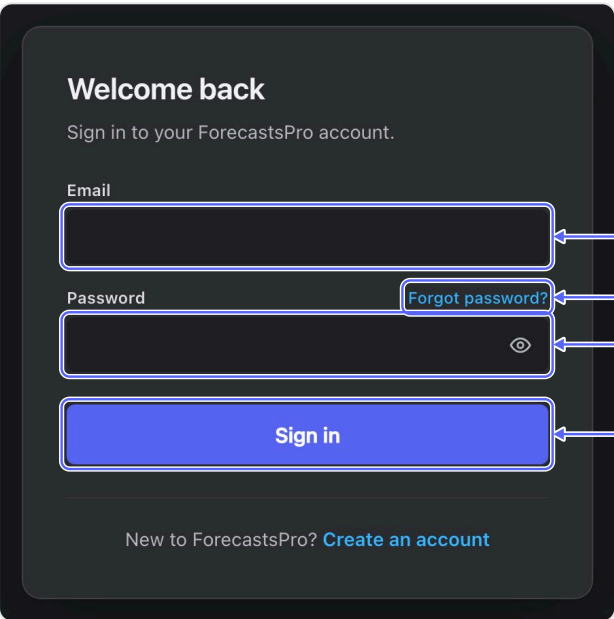

2 Confirm your email

Your receipt email has a button to confirm your address. Press it. Until you do, the banner **Confirm your email** stays at the top of the app, and **Resend email** sends the email again. Real money needs a confirmed email.

Is the address wrong? For the first 48 hours, while it is not confirmed, you can correct it: open **Wrong address?** on the banner, or your Account page.

3 Sign in

The checkout signs you in on that browser. Elsewhere, sign in at app.forecastspro.com with your email and password.

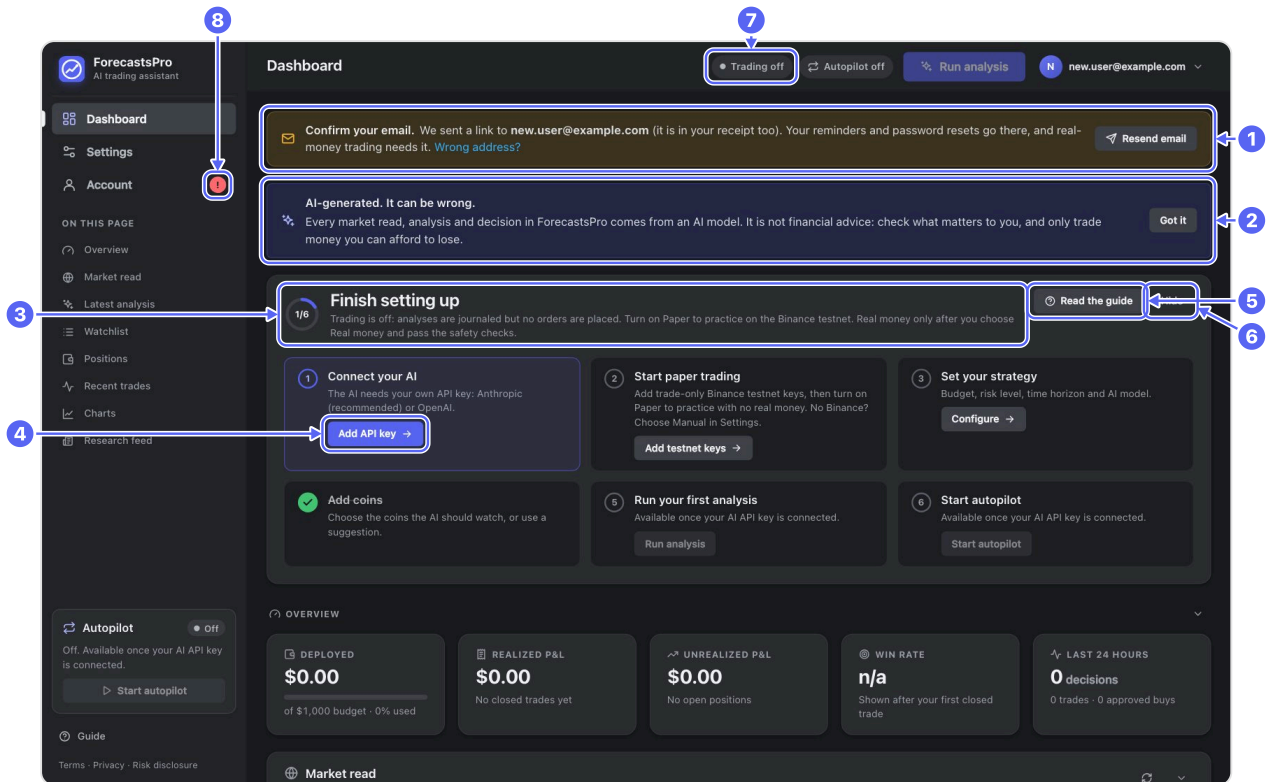

#	NAME	WHAT IT DOES
1	Email	The address you paid with.
2	Password	The eye button shows what you typed.
3	Forgot password?	Sends a reset link to your email.
4	Sign in	Opens your dashboard. A session lasts up to 72 hours on each device.

The sign-in page.

4 Your first look

A new account opens on the dashboard, with a setup checklist at the top. Follow its steps in order.

A new account: trading is off.

#	NAME	WHAT IT DOES
1	Confirm your email	Stays until you confirm your address (step 2).
2	AI notice	Shown once per session: every analysis is AI-generated and can be wrong.
3	Setup checklist	Six steps from a new account to autopilot. The ring shows how many are done.
4	Next step	The highlighted button is always your next step.
5	Read the guide	Opens this guide in a new tab.
6	Hide	Hides the checklist. Everything stays available in Settings.
7	Mode badge	Your mode. A new account has trading off. Press it to open Trading mode in Settings.
8	Account needs you	The ! means an action is waiting on your Account page.

THE SIX SETUP STEPS

1. **Connect your AI:** your AI key.
2. **Start paper trading:** a free Binance testnet key, then Paper. Or pick **Manual** in Settings: the step then shows as done.
3. **Set your strategy:** budget, risk level, time horizon and AI model.
4. **Add coins:** your watchlist. A new account has BTC, ETH and SOL.
5. **Run your first analysis.**
6. **Start autopilot.**

Next: chapter 4 takes you through the setup, step by step.

CHAPTER 04

Set it up

Your AI key, your mode, your strategy and your coins. About 15 minutes, once.

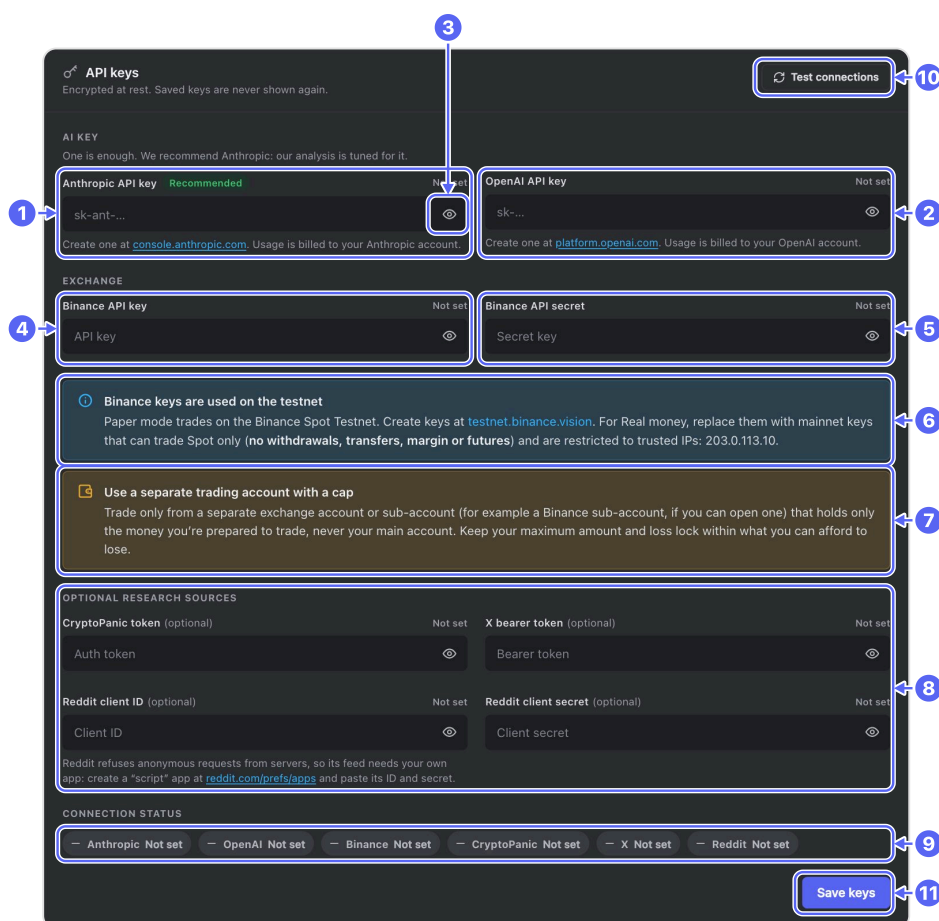

Most of the setup is in **Settings**, which has four cards: Strategy, Trading mode, API keys and Telegram alerts.

1 Connect your AI

The AI works with your own AI API key: a long code from the AI provider, which bills you for what you use. You need an account there, with credit on it.

- **Anthropic (recommended):** create a key at console.anthropic.com.
- **OpenAI:** create a key at platform.openai.com.

1. Open **Settings** in the sidebar and go to the **API keys** card.
2. Paste your key into **Anthropic API key** or **OpenAI API key**.
3. Press **Save keys**. The field then reads **Set**.

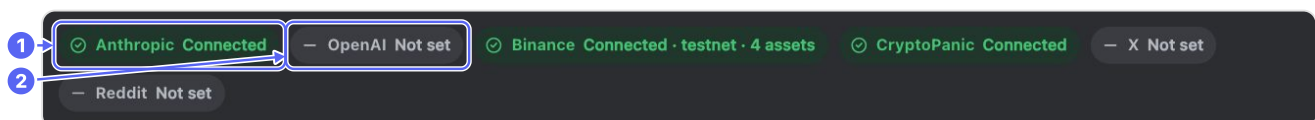

Settings, API keys, on a new account.

#	NAME	WHAT IT DOES
1	Anthropic API key	Recommended: the analysis is tuned for it. Usage is billed to your Anthropic account.
2	OpenAI API key	The alternative. One AI key is enough.
3	Show / hide	Shows what you typed before you save. Saved keys are never shown again.
4	Binance API key	For Paper: a key from the Binance testnet. Manual mode needs none.
5	Binance API secret	The secret that belongs to the same key.
6	Testnet or real account	Says which Binance the keys are used on, where to create them and what a real-money key must allow.
7	Separate account	Our recommendation for Real money (chapter 7).
8	Optional research sources	CryptoPanic, X and Reddit keys add news and social posts. All optional.
9	Connection status	One status per service: Connected, Not set, Invalid or Error.
10	Test connections	Checks every saved key again.
11	Save keys	Encrypts and saves what you typed. Blank fields keep their current value.

2 Connect the Binance testnet

This step is for Paper. The Binance testnet is Binance's public test system, with play money: you need no Binance account. If you only use Manual mode, skip this step.

1. Open testnet.binance.vision and sign in with a GitHub account (free). Create an HMAC API key there.
2. Copy the API key and the secret key now. Keep the secret private.
3. On the **API keys** card, paste them into **Binance API key** and **Binance API secret**.
4. Press **Save keys**. The app then tests your AI key and your Binance keys.

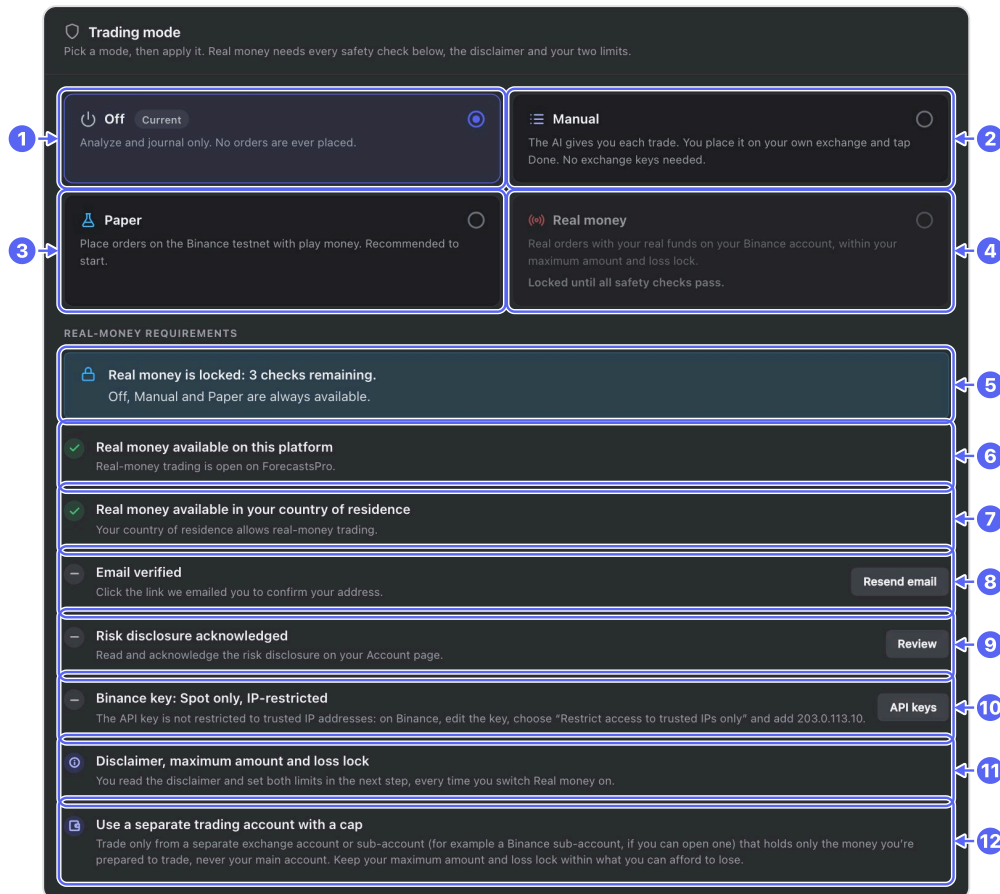

Connection status after saving keys.

#	NAME	WHAT IT DOES
1	Connected	The key works. Binance also says testnet or live (live is your real account). A news source: a key is saved.
2	Not set	No key saved for this service. Fine for the optional sources.

3 Pick Paper or Manual mode

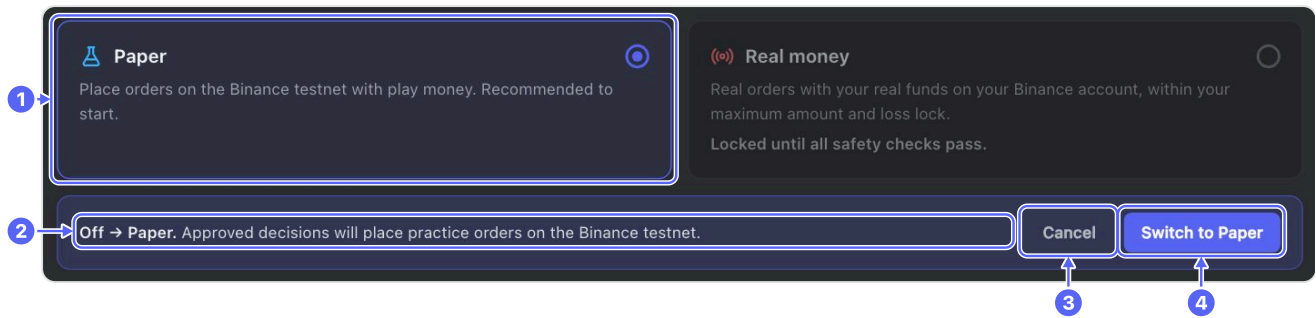

The **Trading mode** card in Settings shows the four modes.

Settings, Trading mode, on a new account.

#	NAME	WHAT IT DOES
1	Off	Analysis only. No order is ever placed.
2	Manual	Manual mode: you place each trade by hand on any exchange. No exchange keys (chapter 8).
3	Paper	Practice orders with play money on the Binance testnet. No Binance account needed.
4	Real money	Automatic orders on your own Binance account. Locked until every safety check below passes.
5	Status	How many safety checks are left. Off, Manual mode and Paper are always available.
6	Platform check	Real money has to be open on ForecastsPro.
7	Country check	Your country of residence has to allow real-money trading.
8	Email verified	Resend email sends the confirmation link again.
9	Risk disclosure	Review takes you to the acknowledgement on your Account page.
10	Trade-only Binance key	Spot only, no withdrawals, restricted to the server IP address shown here.
11	Disclaimer and limits	Asked every time you switch Real money on.
12	Separate account	Recommended, not checked (chapter 7).

1. Pick **Paper** to practice with play money, or **Manual** to place every trade yourself.
2. Read the bar under the cards. It says what will happen. Nothing changes yet.
3. Press **Switch to Paper** or **Switch to Manual**. The mode badge in the top bar then reads **Paper** or **Manual**.

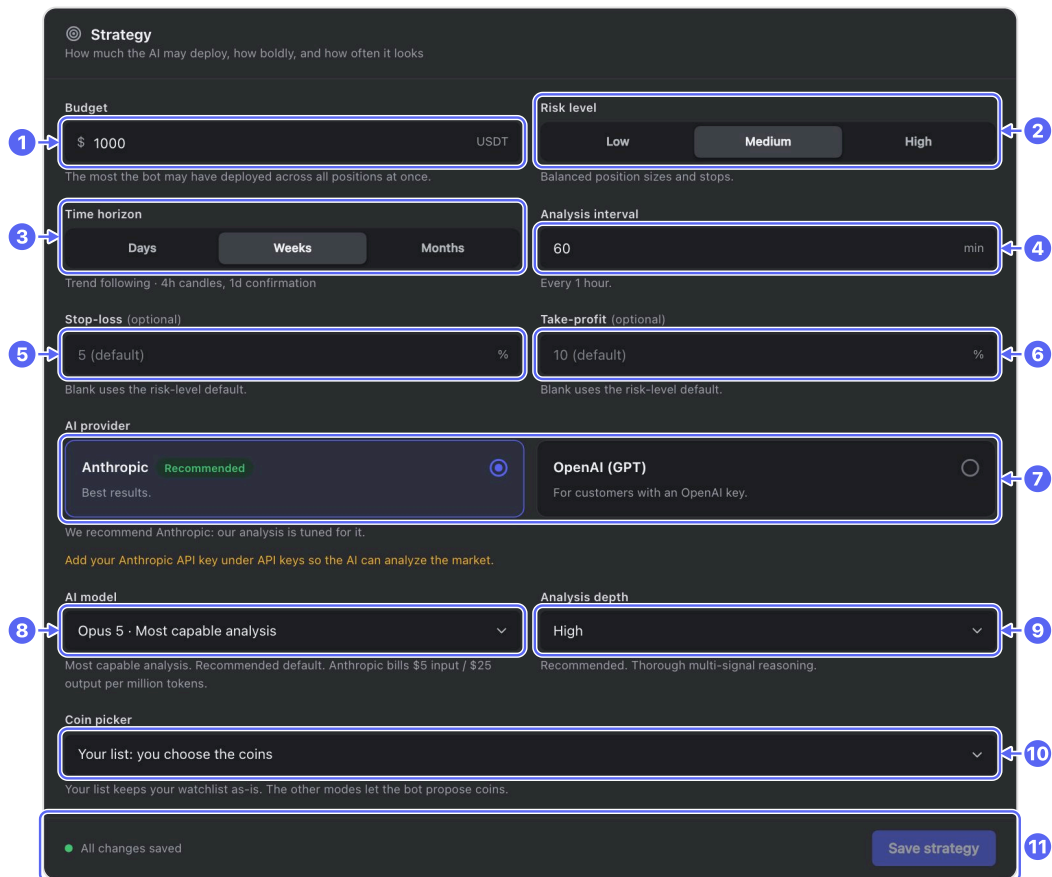

Picking a mode, then applying it.

#	NAME	WHAT IT DOES
1	Pick Paper	Only prepares the change.
2	What will happen	Read what the switch does before you apply it.
3	Cancel	Keeps your current mode.
4	Switch to Paper	Applies the change.

In Paper, every practice order fails without the testnet keys of step 2. In Manual mode, read chapter 8 after chapter 5. You can switch to **Off** at any time.

4 Set your strategy

The **Strategy** card sets your budget, your risk level and how often the AI analyzes. Change what you need, then press **Save strategy**.

Settings, Strategy.

#	NAME	WHAT IT DOES
1	Budget	The most the app may have at work across all positions at once.
2	Risk level	Low, Medium or High: caps, daily-loss limit, minimum confidence, default stop-loss and take-profit (chapter 2).
3	Time horizon	Days, Weeks or Months: which candles the AI reads (chapter 10).
4	Analysis interval	Minutes between two analyses of autopilot. 0 picks the horizon's default.
5	Stop-loss	Optional. Blank uses the risk level's default.
6	Take-profit	Optional. Blank uses the risk level's default.
7	AI provider	Anthropic (recommended) or OpenAI. You need that provider's key.
8	AI model	The hint shows what the provider bills per million tokens.
9	Analysis depth	How long the AI thinks. Deeper costs more.
10	Coin picker	Your list keeps your watchlist as you set it.
11	Save strategy	Saves your changes. Discard appears while something is unsaved.

Time horizon and the automatic interval

With the **Analysis interval** at **0**, your **Time horizon** also sets how often autopilot analyzes.

HORIZON	STYLE	CANDLES READ	INTERVAL AT 0
Days	Swing	1h, confirmed on 4h	every 15 minutes
Weeks	Trend	4h, confirmed on 1d	every 60 minutes
Months	Long term	1d, confirmed on 1w	every 6 hours

You can type your own interval in whole minutes, up to 10,080 (7 days). Autopilot counts 1 to 4 minutes as 5, and the app warns you below 15.

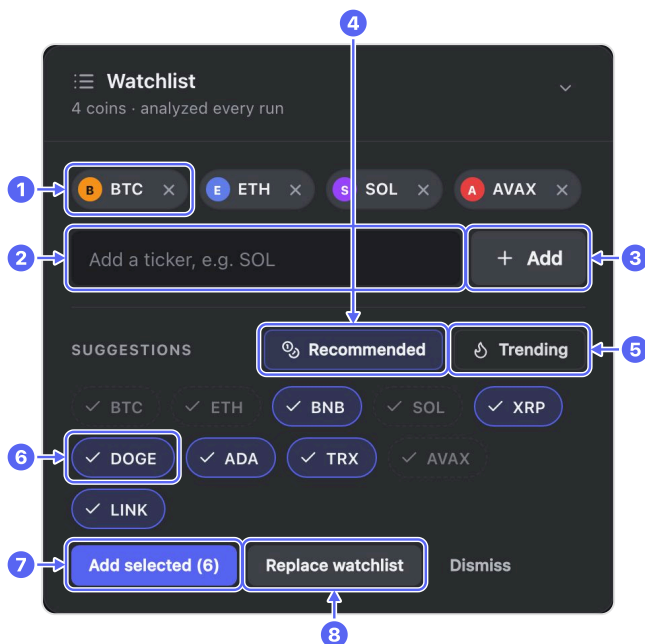

A GOOD FIRST STRATEGY

- **Budget:** the amount you would really trade later. In Paper it is play money.
- **Risk level:** **Low** or **Medium**.
- **Time horizon:** **Weeks**, with the **Analysis interval** at **0**.
- **Stop-loss** and **Take-profit:** blank.
- **AI model:** the recommended one, with **Analysis depth** at **High**.
- **Coin picker:** keep **Your list**.

Your AI provider bills you for every analysis: a cheaper **AI model**, a lower **Analysis depth** or a longer interval lowers the cost.

5 Build your watchlist

The **Watchlist** card on the dashboard holds the coins the AI analyzes. To add a coin, type its ticker (its short name, for example SOL) and press **Add**. The coin must trade against USDT on Binance.

The Watchlist card with suggestions open.

#	NAME	WHAT IT DOES
1	Coin chip	A coin on your watchlist. The x removes it.
2	Add a ticker	Type a ticker such as SOL.
3	Add	Adds the ticker you typed.
4	Recommended	Liquid coins with a top market cap.
5	Trending	Blends what the market is watching now with top market cap.
6	Suggested coin	Picked at first. Press it to leave it out. Greyed coins are already on your list.
7	Add selected	Adds the picked coins to your watchlist.
8	Replace watchlist	Swaps your list for the suggestions (Undo is offered).

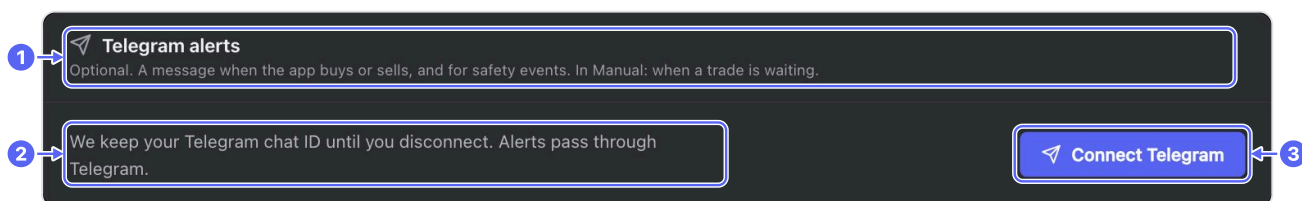

Do not remove a coin while you hold a position in it: the AI then stops analyzing it and cannot sell it.

TIP

5 to 10 well-known coins are enough. More coins cost more AI usage, and small coins often trade at worse prices.

Telegram alerts (optional)

The **Telegram alerts** card in Settings sends a message to your Telegram when something happens in your account. In Manual mode it is the only way to hear about a waiting trade while the app is closed: the app sends no email for it.

Settings, Telegram alerts, before you connect.

#	NAME	WHAT IT DOES
1	Telegram alerts	The last card on Settings.
2	What we keep	Your Telegram chat ID, until you disconnect. Alerts pass through Telegram.
3	Connect Telegram	Makes your one-time link.

Telegram on your phone? Open ForecastsPro there and connect.

1. Press **Connect Telegram**, then **Open Telegram**. The link is only for you. It works once, for 10 minutes.
2. In Telegram, press **Start**. The Telegram bot answers, and the card shows **Connected**.

You get an alert:

- **In Paper and Real money:** when a buy or a sell fills, and when a stop-loss or take-profit fills, with its result.
- **With Real money also:** when the loss lock is reached, when a safety check switches Real money off, or when a position may be without its stop-loss.
- **In Manual mode:** when an analysis gives you trades to place, at most once in 12 hours for the same trades.

To stop, press **Disconnect** on the card, or send /stop to the Telegram bot. A password change or reset also turns the alerts off: connect again afterwards. An alert can fail to arrive, so the app and your emails stay the record.

THE TELEGRAM BOT ONLY SENDS

It never asks for your password, your API keys or money, and it cannot trade.

Your account is set up. Next: chapter 5, your first analysis.

CHAPTER 05

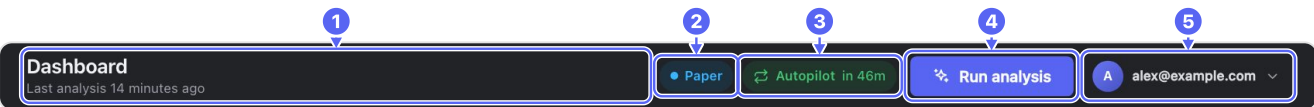

Run it and read every decision

Run an analysis, read each decision, start autopilot and check your positions.

You have a key, a mode and a watchlist. Now run your first analysis and read what comes back.

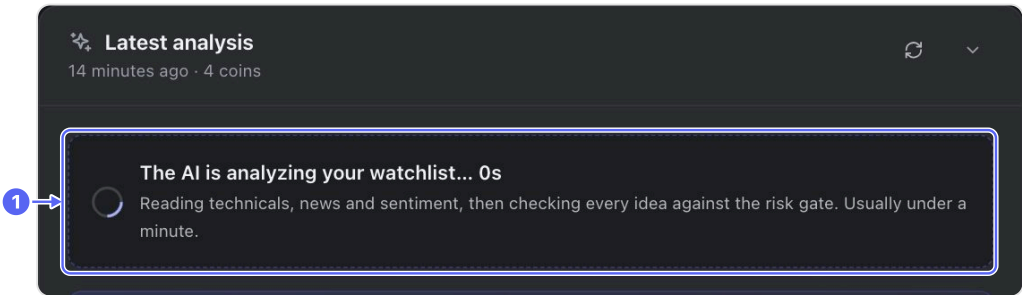

Run analysis

Press **Run analysis** at the top right. It usually takes under a minute.

The top bar, on every page.

#	NAME	WHAT IT DOES
1	Page title	Where you are, and when the last analysis ran.
2	Mode badge	Your mode. Press it to open Trading mode in Settings.
3	Autopilot badge	Time to the next analysis. Press it for the controls.
4	Run analysis	Analyzes your whole watchlist now.
5	Account menu	Account, Settings, Billing, this guide and Sign out.

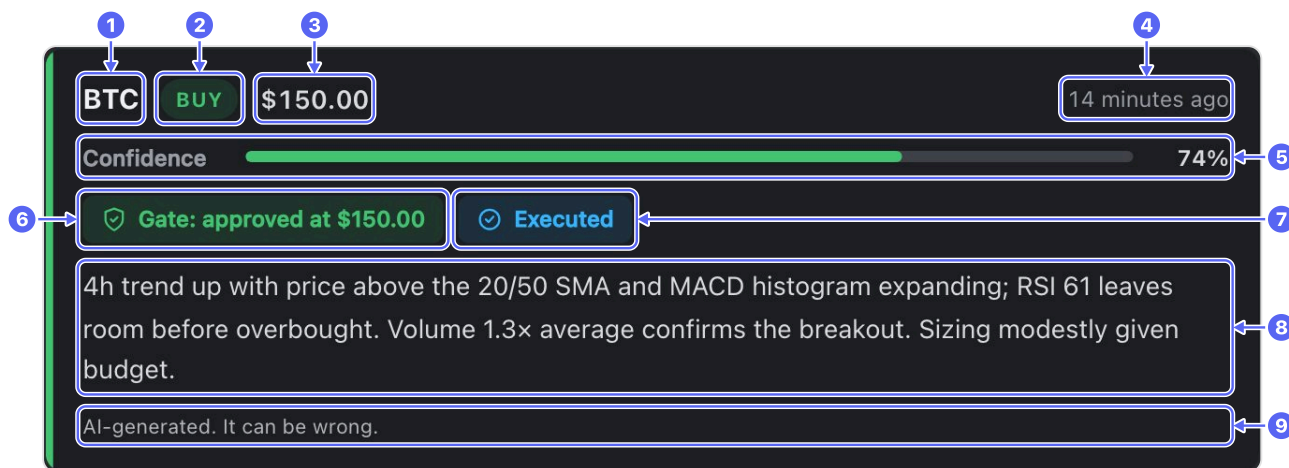

An analysis in progress.

#	NAME	WHAT IT DOES
1	Analysis running	What the card shows while the analysis runs.

If the button is grey, press it: it says what is missing.

Read the decisions

The **Latest analysis** card shows the newest analysis. Here is one decision card, part by part.

One decision card: an approved, executed buy.

#	NAME	WHAT IT DOES
1	Coin	One card per coin on your watchlist.
2	Action	Buy, sell or hold.
3	Size	How much the order is for, in USDT.
4	Time	When the analysis ran.
5	Confidence	How sure the AI is, explained below.
6	Gate verdict	The risk gate approved the decision, sometimes at a smaller size.
7	Executed	The order reached Binance.
8	Reasoning	Why the AI proposes this, in plain words. Long ones have Show more.
9	AI label	Every decision is AI-generated and can be wrong.

Buy, sell or hold

BUY opens a position or adds to it. **SELL** sells all or part of a position. **HOLD** means no order: the AI sees no good trade now.

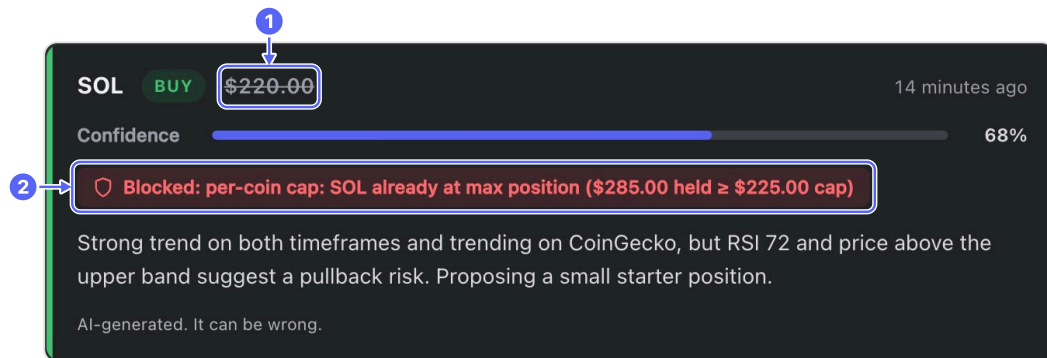

Confidence

How sure the AI is, from 0 to 100%. Below the minimum of your risk level (70% on Low, 60% on Medium, 50% on High) the gate blocks the decision.

The gate's verdict

YOU SEE	WHAT IT MEANS
Gate: approved at \$...	The decision passed every rule at the size the AI proposed.
Gate: hold	A hold: nothing to check and no order.
Gate: approved, clamped to \$... (per-coin cap)	Made smaller to fit a cap. The screen says clamped and names the cap.
Blocked: per-coin cap ...	The coin already has its full share of your budget.
Blocked: total budget cap ...	Your whole budget is already at work.

YOU SEE	WHAT IT MEANS
Blocked: real-money maximum ...	Real money only: your maximum amount is already at work (chapter 7).
Blocked: confidence ... < ... min	The AI was not sure enough for your risk level.
Blocked: daily loss ... exceeds limit	The kill switch paused new buys (chapter 2). Sells still work.
Blocked: no ... position to sell	There is no position in this coin to sell.

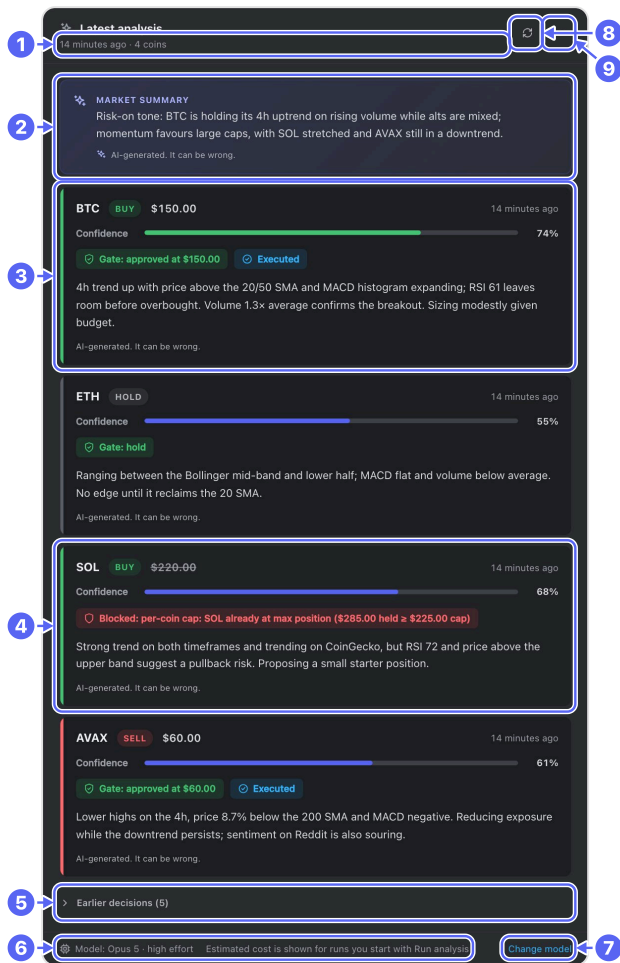

A blocked decision: the per-coin cap was already reached.

#	NAME	WHAT IT DOES
1	Size struck through	Nothing was ordered.
2	Blocked	The rule that blocked the decision, in the gate's words.

What happened to the order

Executed: the app placed the order on Binance. **Not executed:** nothing was placed, for example because your mode is Off. In Manual mode the card has a box, **Place this on your exchange**, and you place the trade yourself (chapter 8).

The whole card

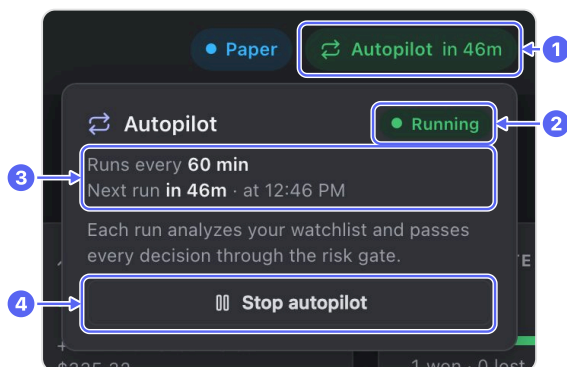

Latest analysis: two approved, one hold, one blocked.

#	NAME	WHAT IT DOES
1	Last analysis	When the latest analysis ran and how many coins it covered.
2	Market summary	The AI's short read of the market in this analysis.
3	Decision cards	One per coin, explained above.
4	A blocked decision	Explained above.
5	Earlier decisions	The analyses before this one: your decision journal. Press to open.
6	Model and cost	The AI model used. An analysis you start yourself also shows its estimated cost.
7	Change model	Opens the Strategy card in Settings.
8	Refresh	Loads the newest decisions.
9	Fold	Folds the card (chapter 6).

Autopilot

Autopilot runs an analysis by itself at your analysis interval (chapter 4). Start it in the sidebar, from the autopilot badge in the top bar, or from the setup checklist. Stopping it cancels no order on Binance.

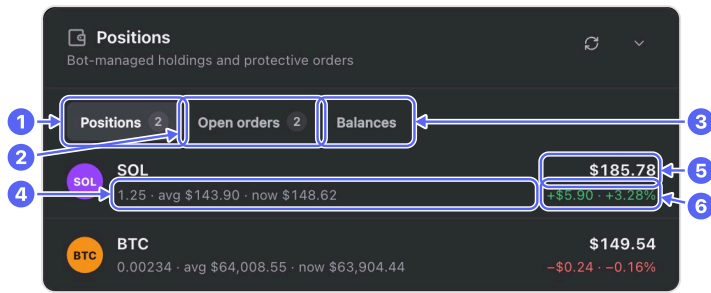

The autopilot controls, opened from the top bar.

#	NAME	WHAT IT DOES
1	Autopilot badge	Press it to open or close these controls.
2	Status	Running or Off.
3	Schedule	Your analysis interval, and when the next analysis is due.
4	Start / Stop autopilot	Starts or stops the scheduled analyses.

Positions, open orders and trades

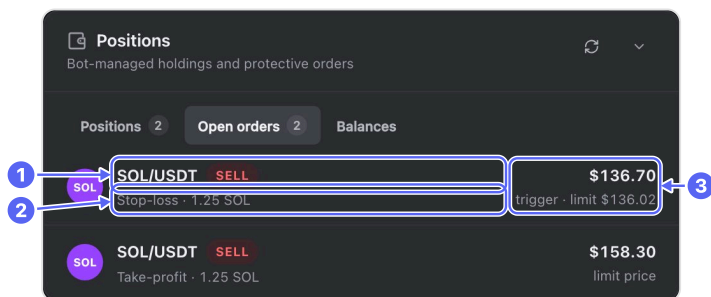

The **Positions** card has three tabs. In Manual mode it has none: it shows the positions from the trades you confirmed, each with a **Sold** button (chapter 8).

Positions.

#	NAME	WHAT IT DOES
1	Positions	Coins the app bought and still holds, with how many.
2	Open orders	Your stop-loss and take-profit orders on Binance.
3	Balances	Everything in the connected Binance account.
4	Quantity and prices	Amount held, average cost and the price now.
5	Value	What the position is worth now.
6	Unrealized P&L	Gain or loss if you sold now, in dollars and percent.

Open orders shows the orders on Binance for the coins on your watchlist: the stop-loss and the take-profit of each position. **Balances** also says whether the account is the testnet (play money) or your real account.

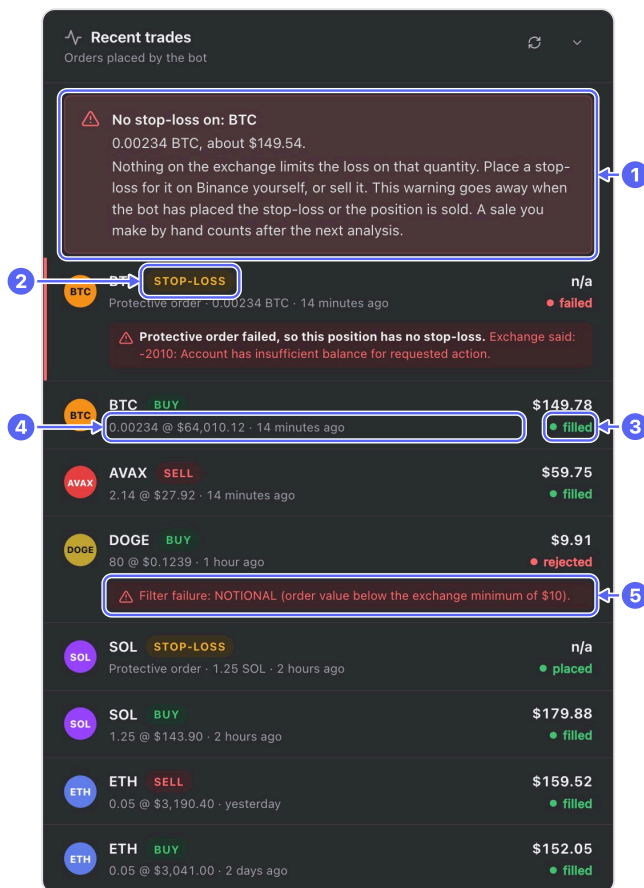

Open orders: the stop-loss and take-profit of each position.

#	NAME	WHAT IT DOES
1	Pair and side	The coin pair and whether the order sells or buys.
2	Order type	Stop-loss or Take-profit, and the quantity.
3	Trigger price	The price at which the order triggers.

Recent trades

Every order the app placed, newest first, with its status: *filled*, *placed* (a stop-loss or take-profit that waits on Binance), *partly filled*, *rejected*, *failed*, *error* or *skipped*.

Recent trades, with the red No stop-loss warning.

#	NAME	WHAT IT DOES
1	No stop-loss warning	A position may have no stop-loss on Binance. The box below says what to do.
2	Protective order	The stop-loss and take-profit the app placed after a buy.
3	Status	Filled, placed, partly filled, rejected, failed, error or skipped.
4	Quantity and price	How much, at what price, and when.
5	Exchange message	Why Binance refused an order, in its own words.

IF YOU SEE A RED "NO STOP-LOSS" BOX

A position may have no stop-loss on Binance. While trading is on, the app tries to place it again. If the box stays, place a stop-loss on Binance yourself for the quantity in the box, or sell that quantity. The box goes away when the app has placed the stop-loss or the position is sold. Your own stop-loss does not remove it.

Next: chapter 6 explains every screen. To trade for real, read chapter 7 (Real money) or chapter 8 (Manual mode).

CHAPTER 06

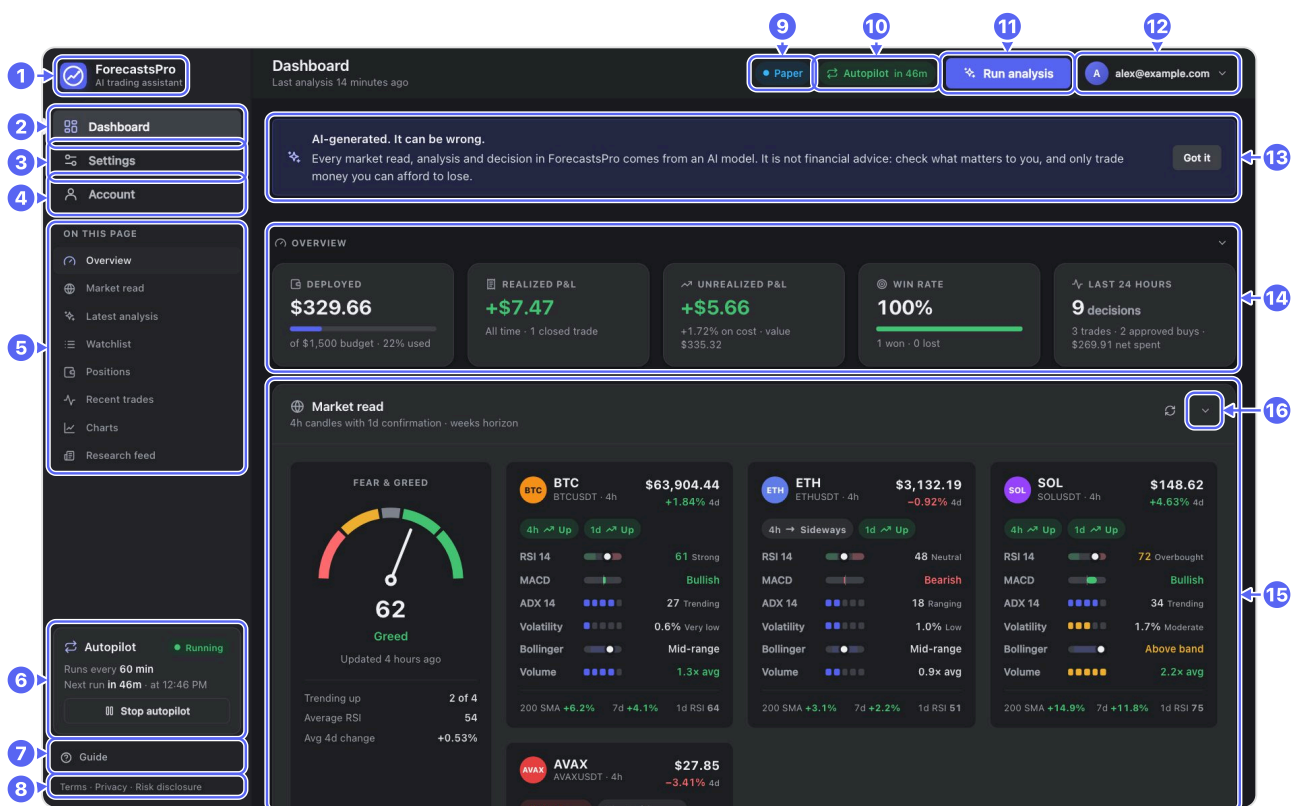

The full tour: every screen and button

Every screen, every button, every box: numbered on the screenshot, explained in its legend.

This chapter is the reference.

The app frame

The sidebar and the top bar stay the same on every page. Settings is not in this tour: chapter 4 explains its four cards.

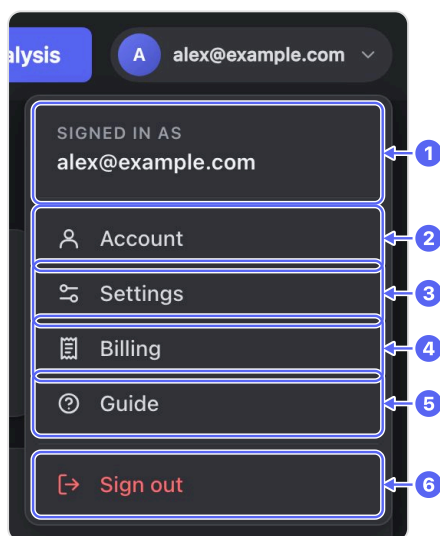

The dashboard of an account in Paper.

#	NAME	WHAT IT DOES
1	Logo	Back to the dashboard from anywhere.
2	Dashboard	Market read, decisions, positions and trades.
3	Settings	Everything you set up, in four cards.
4	Account	Profile, subscription, risk disclosure, password and your data.
5	On this page	Takes you to a card of this page and opens it when it is folded.
6	Autopilot	Scheduled analyses: the status, the next one, start and stop.
7	Guide	This guide, in a new tab.
8	Legal	Terms, Privacy Policy and Risk Disclosure.

#	NAME	WHAT IT DOES
9	Mode badge	Your mode. Press it to open Trading mode in Settings.
10	Autopilot badge	Time to the next analysis. Press it for the controls.
11	Run analysis	Analyzes your whole watchlist now.
12	Account menu	Account, Settings, Billing, this guide and Sign out.
13	AI notice	Once per session. Got it closes it.
14	Overview	Your key figures, for the mode you are in.
15	Market read	The market numbers of every coin on your watchlist.
16	Fold	Every card has this arrow. It folds the card down to its title.

The account menu

#	NAME	WHAT IT DOES
1	Signed in as	The account you are using.
2	Account	Profile, subscription and security.
3	Settings	Strategy, mode, keys and Telegram alerts.
4	Billing	Your access, renewal and receipts.
5	Guide	Opens this guide in a new tab.
6	Sign out	Ends this session on this device.

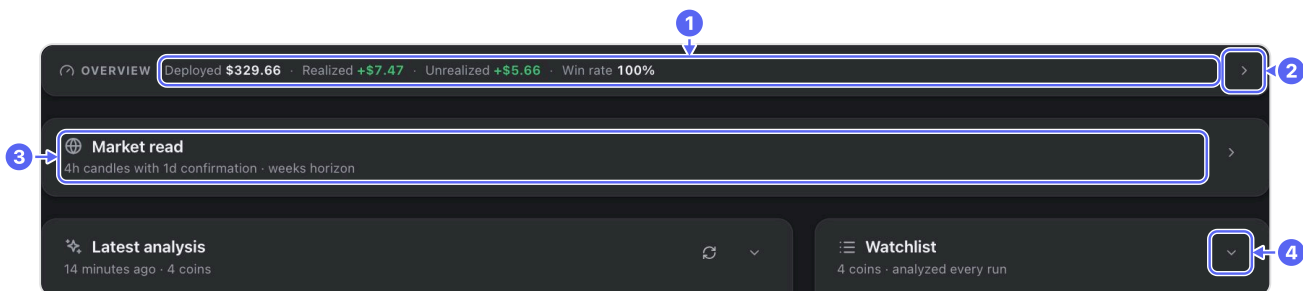

The account menu, under your email address at the top right.

The dashboard, card by card

The dashboard is a column of cards, top to bottom: Overview, Market read, Latest analysis, Watchlist, Positions, Recent trades, Charts and Research feed. In Manual mode some cards differ (chapter 8).

Fold a card

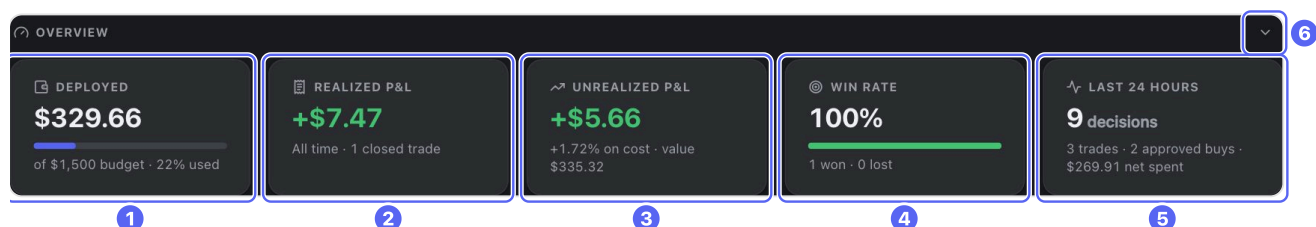

Folding only hides a card: nothing else changes. The app remembers what you folded, on that browser.

Overview and Market read folded, Latest analysis and Watchlist open.

#	NAME	WHAT IT DOES
1	Overview, folded	What stays when the Overview is folded.
2	Open	Opens it again. Pressing anywhere on the bar does the same.
3	A folded card	Only its title and one line stay.
4	Fold	Folds an open card.

Overview: your key figures

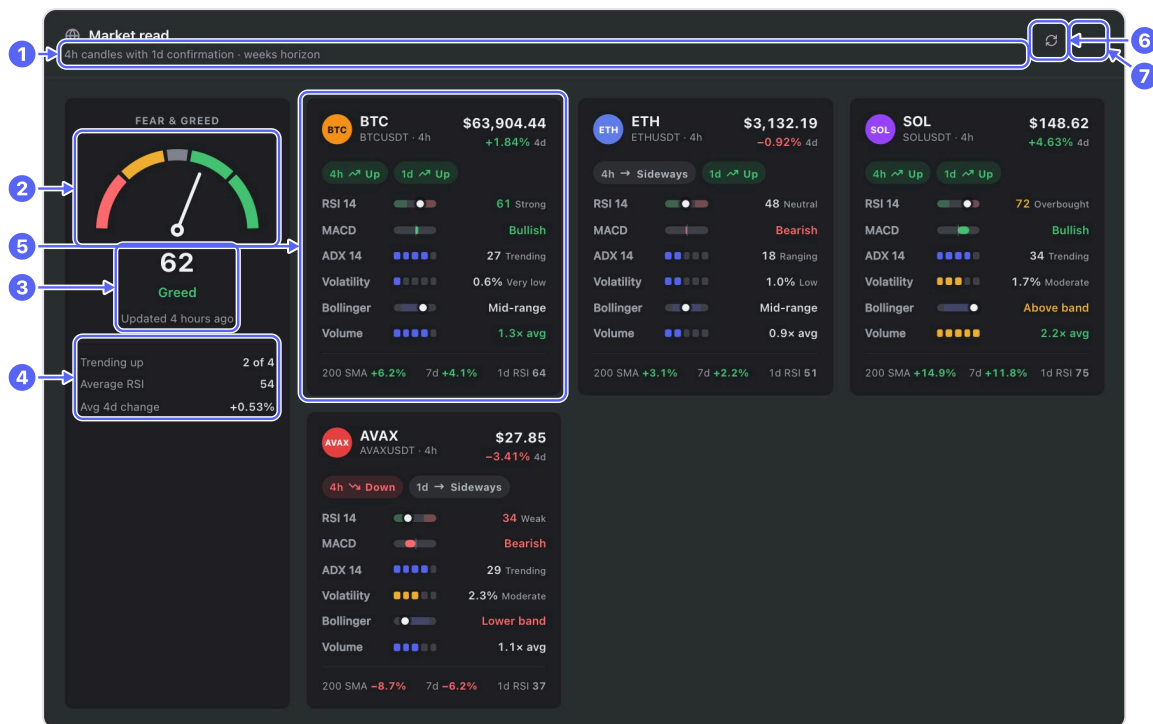

The Overview strip.

#	NAME	WHAT IT DOES
1	Deployed	Money at work in open positions, against your budget.
2	Realized P&L	Profit or loss of closed trades, all time.
3	Unrealized P&L	Gain or loss of open positions at today's price.
4	Win rate	Share of closed trades that ended in profit.
5	Last 24 hours	Decisions, trades, approved buys and net money flow.
6	Fold	Folds the Overview into one line that keeps the first four figures.

The figures count only the trades the app placed, or in Manual mode the trades you confirmed. Paper, Real money and Manual mode each keep their own figures. The Overview, Positions and Recent trades show only the mode you are in. In Off you see Paper or Real money, whichever of the two you used last.

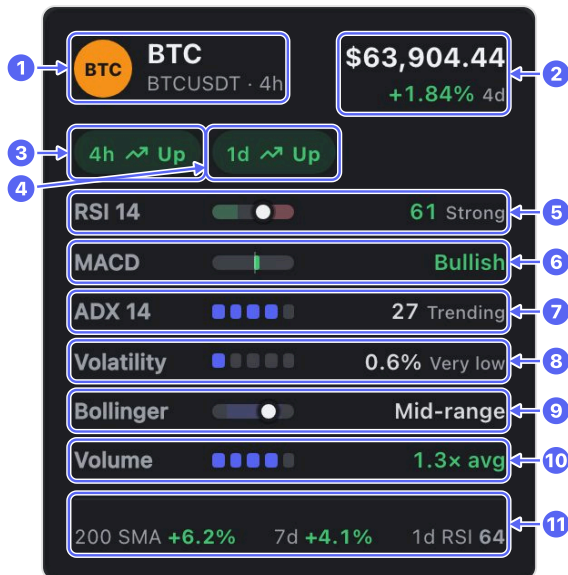

Market read

Market read: the Fear & Greed gauge and one card for each coin.

#	NAME	WHAT IT DOES
1	Timeframes	The candles used, set by your time horizon.
2	Fear & Greed	Crypto crowd mood: 0 extreme fear, 100 extreme greed.
3	Reading	Today's value, its label and when it was updated.
4	Watchlist mood	Coins trending up, average RSI and average change.
5	Coin card	One per watchlist coin. The next picture explains it row by row.
6	Refresh	Reloads market data now.
7	Fold	Folds the card.

One color rule holds everywhere: green is strong or up, red is weak or down. Amber marks a price that rose or fell very far, or that moves a lot. Chapter 10 explains every number.

One coin card, row by row.

#	NAME	WHAT IT DOES
1	Coin and pair	Ticker, Binance pair and candle size.
2	Price and change	The price now, and its change over the last 24 candles.
3	Trend	Up, Down or Sideways on the trading timeframe.
4	Higher trend	The same on the next timeframe up.
5	RSI 14	Momentum, 0 to 100.
6	MACD	Momentum direction: Bullish or Bearish.
7	ADX 14	Trend strength: Trending or Ranging.
8	Volatility	Average candle size (ATR) as % of price.
9	Bollinger	Where the price sits in its bands.
10	Volume	Recent volume against its average.
11	Context	Distance from the 200 SMA, the change over 168 candles and the higher timeframe's RSI.

Latest analysis and Watchlist

See chapter 5, and chapter 4 for the Watchlist.

Positions and Recent trades

See chapter 5. Both cards also refresh by themselves.

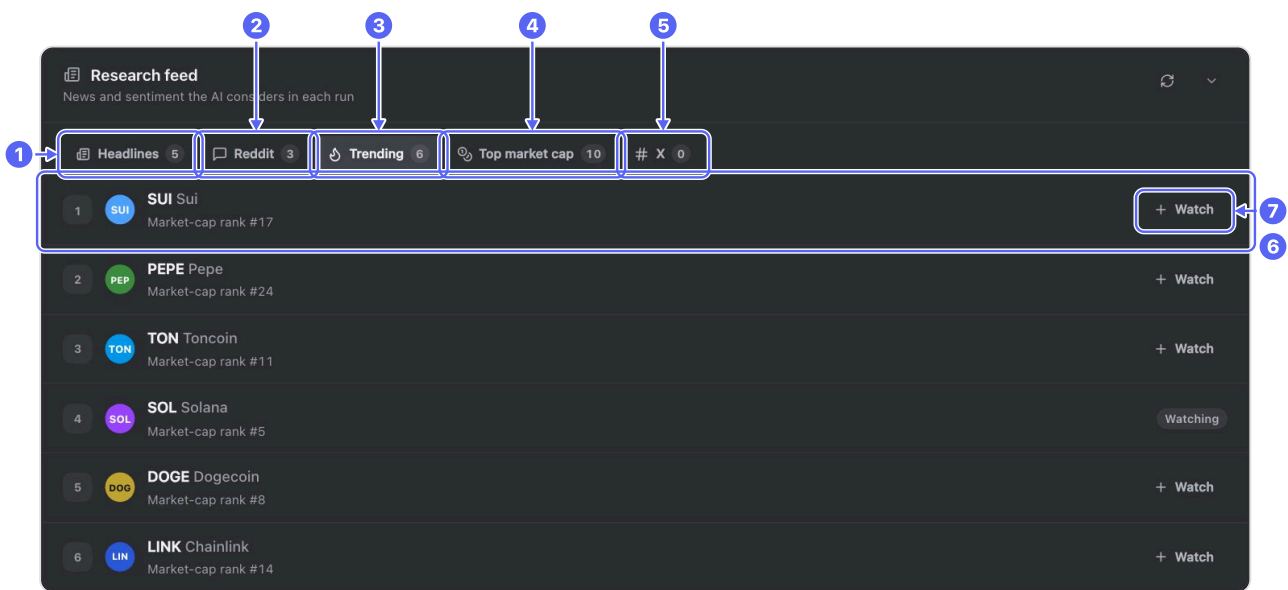

Charts

A TradingView chart for each coin on your watchlist.

#	NAME	WHAT IT DOES
1	Coin tabs	One tab per watchlist coin.
2	Chart	Candles sized to your horizon. Loads when you scroll to it.

Research feed

The Research feed: news and sentiment the AI reads in each analysis.

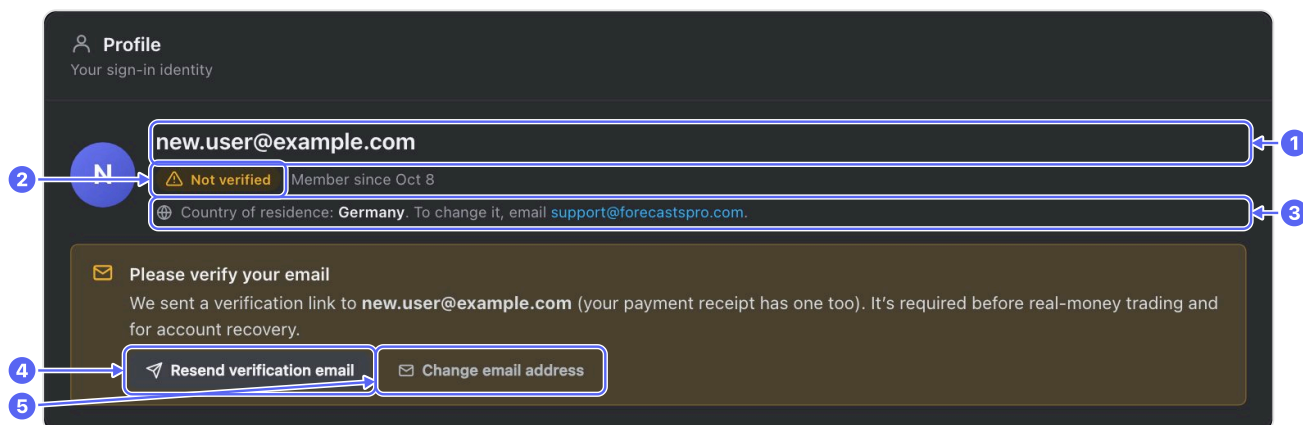

#	NAME	WHAT IT DOES
1	Headlines	News for your coins (needs your CryptoPanic token).
2	Reddit	Hot posts from crypto communities (needs your Reddit client ID and secret).
3	Trending	What the market is searching for now.
4	Top market cap	The largest coins, with price and 24h change.
5	X	Posts about your coins (needs your X bearer token).

#	NAME	WHAT IT DOES
6	Item	Rank, coin and market-cap rank.
7	Watch	Adds the coin to your watchlist.

Your Account page

Open **Account** in the sidebar. A red ! next to it means your email is not confirmed or the Risk Disclosure is not acknowledged.

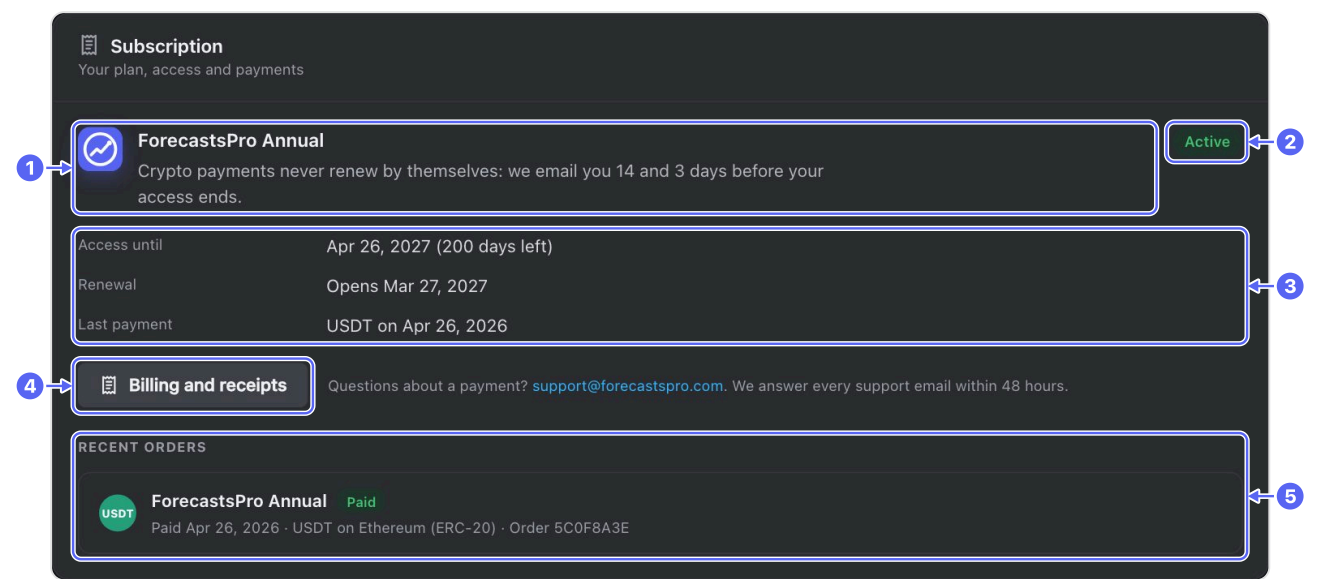

Profile

Profile, before the email address is confirmed.

#	NAME	WHAT IT DOES
1	Your email	The address you sign in with.
2	Verification	Email verified or Not verified.
3	Country of residence	To change it, email support.
4	Resend verification email	Sends the confirmation link again.
5	Change email address	Fixes a typo in the first 48 hours, while unconfirmed.

Subscription

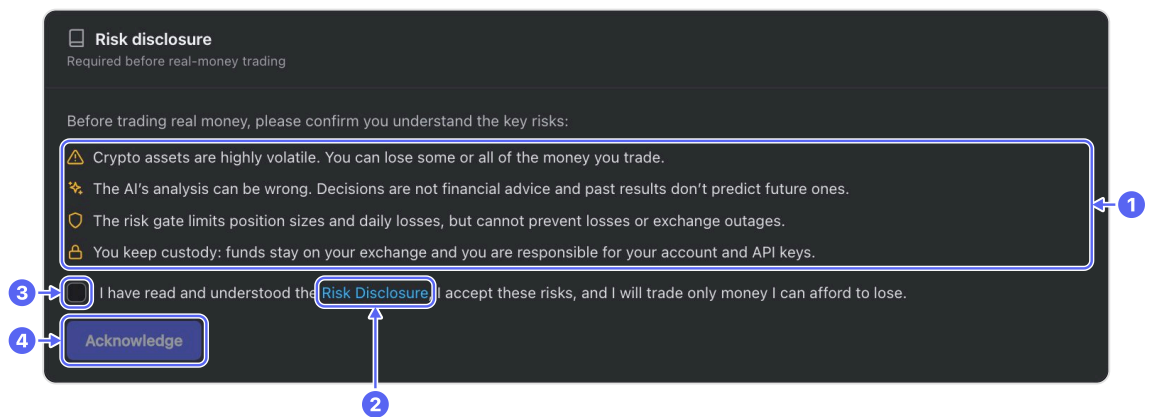

Subscription.

#	NAME	WHAT IT DOES
1	Your plan	ForecastsPro Annual.
2	Status	Active, ending soon or ended.
3	Access facts	Access end date, when renewal opens and your last payment.
4	Billing and receipts	Opens the Billing page.
5	Recent orders	Your payments with their status and order number.

Risk disclosure

Real money needs this acknowledgement (chapter 7).

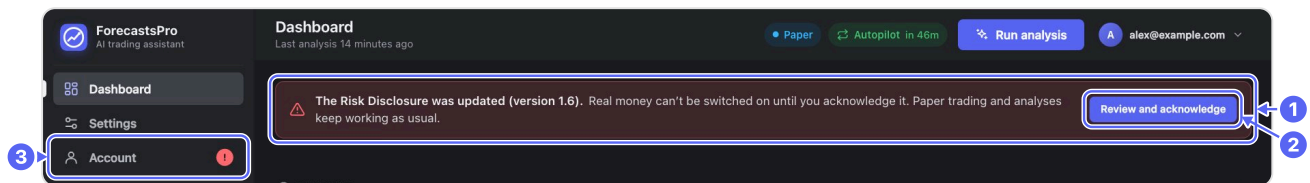

Risk disclosure, not yet acknowledged.

#	NAME	WHAT IT DOES
1	Key risks	The four things to understand before you switch to Real money.
2	Risk Disclosure	Opens the full document.
3	Acknowledgement box	Tick it once you have read and accepted the risks.
4	Acknowledge	Records your acknowledgement and the version you accepted.

A new version of the Risk Disclosure

When we publish a new version, the app asks you to acknowledge it again. Until you do, you cannot switch Real money on. Real money that is already on keeps running until it is switched off. Off, Paper and Manual mode keep working.

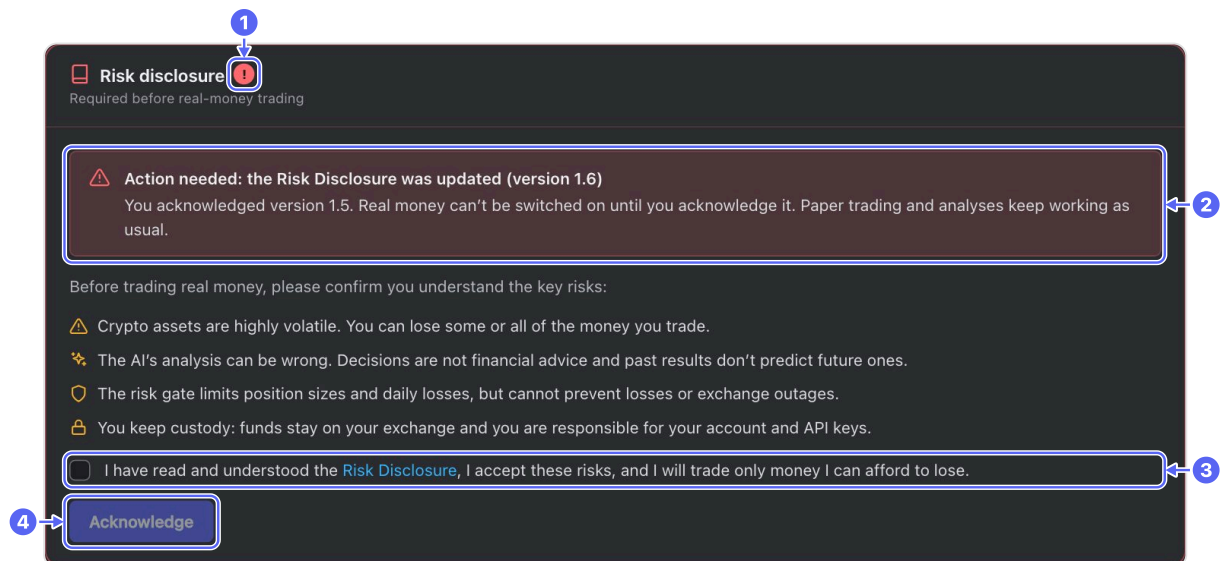

The red banner and the red ! after a new version.

#	NAME	WHAT IT DOES
1	Red banner	On every page until you acknowledge the new version.
2	Review and acknowledge	Opens the Risk disclosure card on your Account page.
3	Account !	The red ! shows which page needs you.

1. Press **Review and acknowledge** in the red banner.
2. Open the **Risk Disclosure** link on the card and read the new version.
3. Tick the box and press **Acknowledge**.

The banner and the red marks then go away.

The Risk disclosure card, asking for the new version.

#	NAME	WHAT IT DOES
1	Red ! by the title	A new version of the Risk Disclosure is waiting for you.
2	What changed	The new version, the one you accepted before, and what is limited until you acknowledge.
3	Read and tick	The link to the new version, and the box to tick.
4	Acknowledge	Records the new version on your account.

Password, sessions, your data and deleting your account

Change password
Changing it signs out every other session

1 →

2 →

At least 10 characters.

3 →

4 → **Update password**

Change password.

#	NAME	WHAT IT DOES
1	Current password	Proves it is you.
2	New password	The meter under it shows how strong it is.
3	Confirm new password	Type the new password again.
4	Update password	Saves it, signs out every other session and turns Telegram alerts off.

Sessions
Where you're signed in

Sessions last up to 72 hours per device and are protected by a secure, HTTP-only cookie. Changing or resetting your password signs out all other sessions.

1 → **Sign out**

Your data
A copy of everything we keep about your account

One JSON file with your account, settings (never your API keys), every decision and trade in your journal, your orders, sessions and security log.

2 → **Download my data**

Delete account
Permanent and cannot be undone

Deleting your account removes all of your data from ForecastsPro. Your exchange account and its funds are untouched.

3 → **Delete account...**

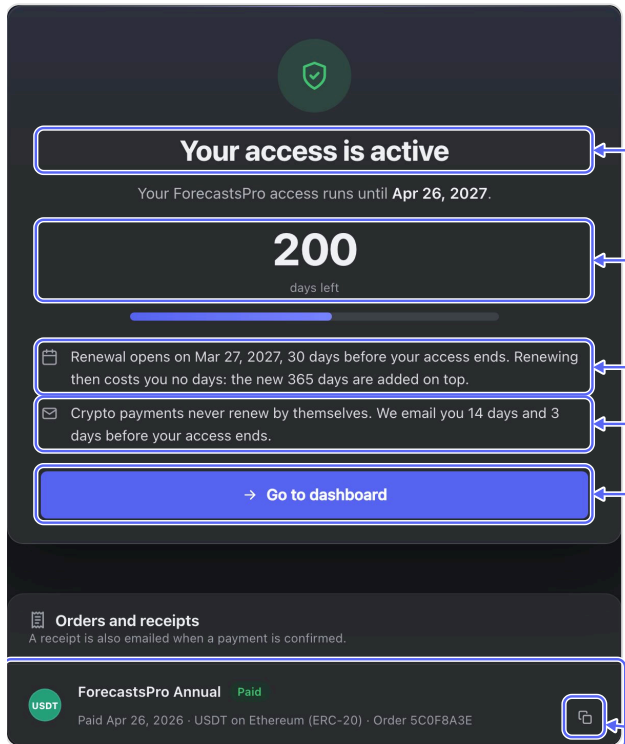

Sessions, Your data and Delete account.

#	NAME	WHAT IT DOES
1	Sign out	Ends the session on this device.
2	Download my data	One file: your account, settings (never your keys), journal, orders and any Telegram chat ID.
3	Delete account	Permanent. The app asks for your password first.

Deleting your account permanently removes your settings, your encrypted keys, your decision journal and your security log. Your exchange account and its money are not touched, and orders already on Binance stay there.

Billing and renewal

Open **Billing** in the account menu. Near the end of your access, a banner in the app has a **Renew** button.

The screenshot shows the 'Billing' page in the app. At the top, a green shield icon indicates active status. Below it, a box says 'Your access is active' with a subtext 'Your ForecastsPro access runs until Apr 26, 2027.' A large '200' indicates 'days left' with a progress bar. Below this, two informational boxes are shown: one about renewal timing and another about crypto payments. A blue button labeled 'Go to dashboard' is present. At the bottom, an 'Orders and receipts' section shows a 'ForecastsPro Annual' order for 'Paid' with details like 'Paid Apr 26, 2026 - USDT on Ethereum (ERC-20) - Order 5C0F8A3E'. A copy icon is next to the order ID. Numbered callouts 1 through 7 point to specific elements: 1 points to the 'Your access is active' box, 2 points to the '200 days left' box, 3 points to the first renewal info box, 4 points to the second renewal info box, 5 points to the 'Go to dashboard' button, 6 points to the order ID, and 7 points to the copy icon.

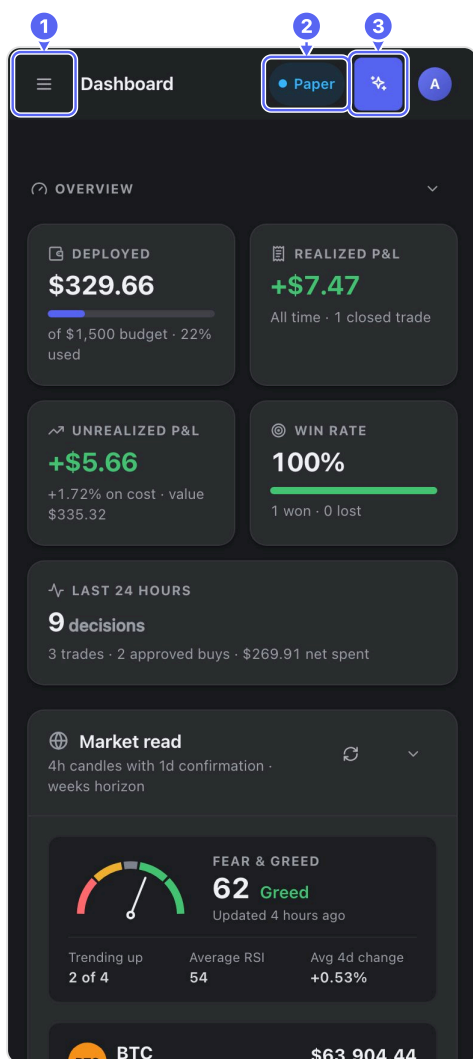

#	NAME	WHAT IT DOES
1	Access status	Whether your access is active, and until when.
2	Days left	Counts down to the end of your access.
3	Renewal	Opens 30 days before the end. The new 365 days are added on top.
4	Reminders	Nothing renews by itself. We email you 14 and 3 days before the end and on the day it ends.
5	Go to dashboard	Back to the app.
6	Receipt	Each order with its status, coin, network and order number.
7	Copy order ID	Copies the order number for an email to support.

The Billing page while your access is active.

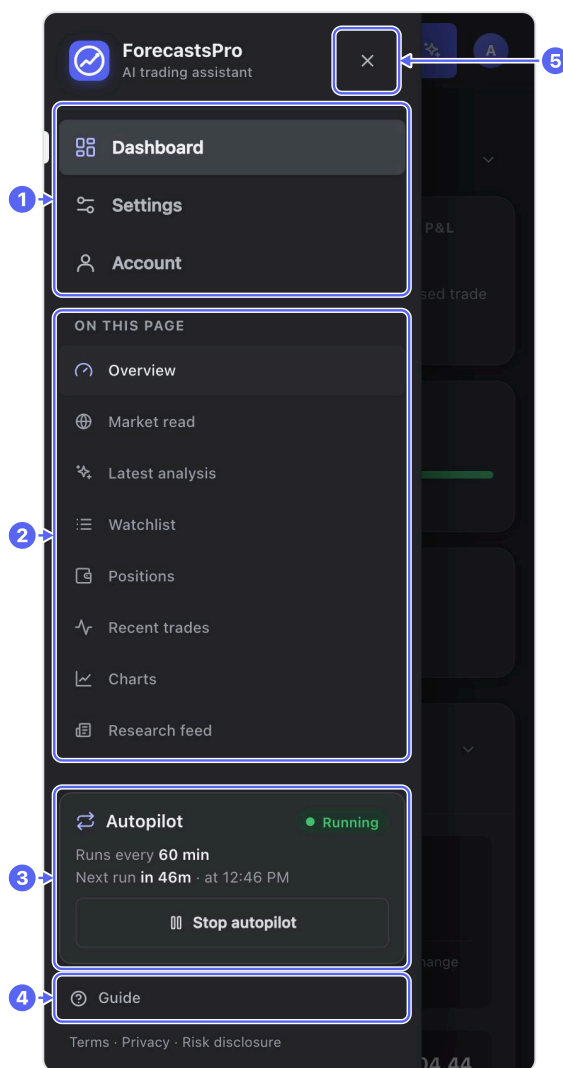

If your access ends, analyses and new orders stop. Nothing is sold: your positions and their orders stay on Binance. After you renew, Real money is off. Switch it on again in Settings (chapter 7).

On your phone

ForecastsPro works in the browser of your phone.

The dashboard on a phone.

The menu, opened.

#	NAME	WHAT IT DOES
1	Menu	Opens the sidebar: pages, On this page and autopilot.
2	Mode badge	Your mode.
3	Run analysis	Same as on a computer.

#	NAME	WHAT IT DOES
1	Pages	Dashboard, Settings and Account.
2	On this page	Takes you to a card of this page.
3	Autopilot	Start or stop scheduled analyses.
4	Guide	This guide, on your phone too.
5	Close	Closes the menu.

Next: chapter 7 for Real money, or chapter 8 for Manual mode.

Real money: automatic on Binance

Only when you are ready, only with money you can afford to lose, and only within limits you set.

BEFORE YOU START

Real-money trading can lose money, and the AI can be wrong. Take this step only after a few weeks in Paper, when you understand how the decisions and the risk gate behave. Real-money trading, where available, may be restricted in your country (for example the EU/EEA, UK or US) because of local rules or Binance availability. The first two safety checks on the **Trading mode** card say whether Real money is open for you: look there first. No Binance where you live? Manual mode works with any exchange, and you place every order yourself (chapter 8).

Real money is the automatic mode: the app places real orders on your own Binance account, inside two limits you set.

1 Confirm your email

Press the button in your receipt email (chapter 3). **Resend verification email** on your Account page sends it again.

2 Acknowledge the Risk Disclosure

On the **Risk disclosure** card of your Account page, read the document, tick the box and press **Acknowledge**. A new version asks you again (chapter 6).

3 Use a separate account

Open a separate Binance account or sub-account. Move into it only the money you are prepared to trade. Never connect your main account or your savings.

4 Create a trade-only Binance key

First switch to **Off** on the **Trading mode** card: Paper cannot use the new key. Then copy our server IP address from the **API keys** card.

On Binance, open API Management for that account, create a new API key and set its permissions:

TURN ON

- **Enable Spot & Margin Trading** (reading is on by default)
- **Restrict access to trusted IPs only**, with our server IP address

LEAVE OFF

- Withdrawals
- Internal and universal transfers
- Margin loans
- Futures, options and portfolio margin

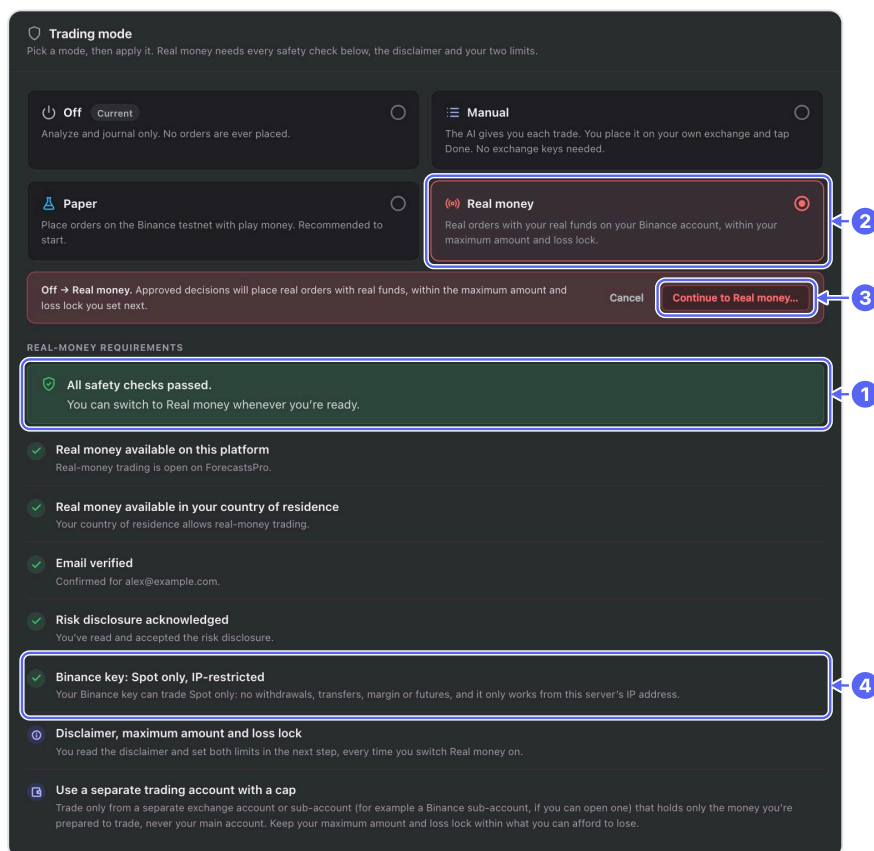

5 Save the new keys

1. On the **API keys** card, paste the new key and its secret into the two Binance fields. They replace your testnet keys, if you have any.
2. Press **Save keys**.
3. On the **Trading mode** card, the line **Binance key: Spot only, IP-restricted** must show a green check. If not, it says what to fix.

Before your first switch to Real money, **Connection status** tests the key on the Binance testnet and shows **Invalid**. That is expected.

6 Check the list, then pick Real money

On the **Trading mode** card, every safety check now shows a green check. Pick **Real money**, then press **Continue to Real money....**

All safety checks passed, Real money picked.

#	NAME	WHAT IT DOES
1	All checks passed	You can pick Real money when you are ready.
2	Real money	Picked. Nothing changes yet.
3	Continue to Real money	Opens the disclaimer and your two limits.
4	Trade-only key	Spot only, no withdrawals, restricted to the server IP.

7 Read the disclaimer and set your two limits

Switch to Real money
Read the disclaimer, set your two limits, then confirm. You can switch back to Paper or Off at any time.

Real-money trading: read this before you switch it on
What ForecastsPro does, step by step (Terms of Service, section 2), in each analysis cycle: on the schedule you set (autopilot) or when you press Run analysis.

1. It reads market data. It reads public market data for the coins on your watchlist, computes technical indicators on two timeframes, and reads the news and sentiment sources you connect.
2. It asks the AI. Through your own API key with the AI provider you choose (Anthropic or OpenAI) it asks the AI model to propose one decision per coin (buy, sell or hold) with a size, a confidence score and its reasoning.
3. The risk gate checks your limits. Every proposal passes hard-coded risk rules that the AI cannot override (your budget, per-coin limits, a daily-loss pause and, in Real money mode, the maximum amount and the loss lock you set below); a proposal that breaks one is rejected or made smaller.
4. In Paper mode, orders go to the test network. The orders that pass the risk gate are sent to Binance's test network, with test funds that have no real value.

Loss count
Your loss is counted from the moment you switch Real money on.

Maximum real-money amount **Loss lock**

\$ e.g. 500 USD \$ 100 USD

The most the bot may have at work at once: its positions and pending buys. Your budget still applies; the lower one wins. When your loss from now on reaches this, all trading stops and we email you. Any amount; \$100 suggested.

Recommended: a separate sub-account (on Binance, if you can open one) that holds only what you're prepared to trade, never your main account, with both limits within what you can afford to lose.

☐ I have read this disclaimer and I accept it. I understand that ForecastsPro will trade real money on my Binance account automatically and that I can lose money.

Questions before you start? support@forecastspro.com. We answer every support email within 48 hours.

Cancel **Switch Real money on**

#	NAME	WHAT IT DOES
1	Disclaimer	Read it to the end. It has a version number.
2	Loss count	Your loss is counted from the moment you switch on.
3	Maximum real-money amount	The most the app may have at work at one time. Your budget still applies, and the lower one wins.
4	Loss lock	When your loss reaches it, all trading stops. Nothing is sold. \$100 suggested.
5	Separate account	Keep both limits within what you can afford to lose.
6	Accept	Tick to accept the disclaimer.
7	Switch Real money on	Switches Real money on. The app checks everything again first.

The Real-money dialog.

Type a small **Maximum real-money amount** and a **Loss lock** you can accept.

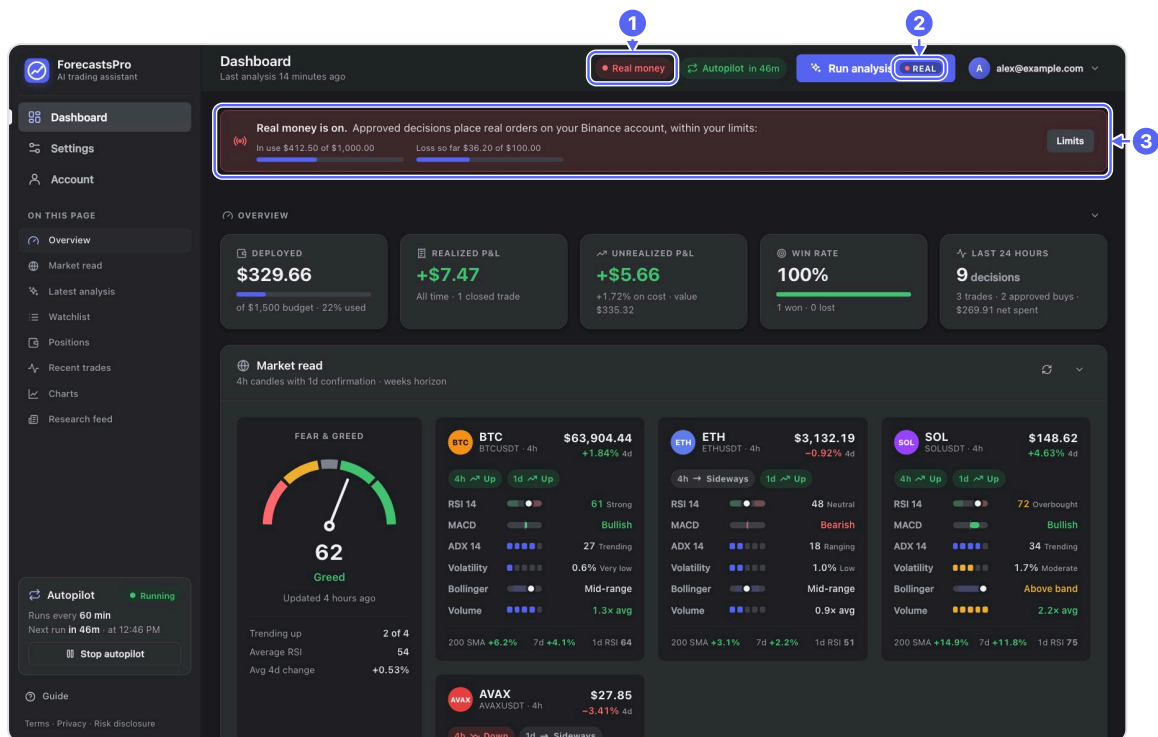

Is autopilot running? Its next analysis can then place real orders without asking you. Stop autopilot first if you do not want that.

Then tick the box and press **Switch Real money on**. Real money is now on.

8 Start small

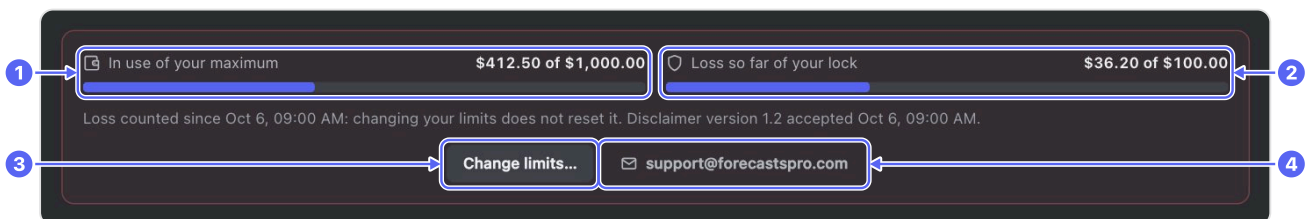

Keep the risk level at Low or Medium. Raise your limits only after weeks of results you understand, never to recover a loss.

While Real money is on

Real money on: a red mode badge, the Real tag and a banner on every page.

#	NAME	WHAT IT DOES
1	Real money	The mode badge turns red while Real money is on.
2	Real tag	An analysis you start places real orders. The app asks you to confirm first.
3	Real-money banner	On every page: the amount at work and the loss so far against your limits.

Your limits on the Trading mode card.

#	NAME	WHAT IT DOES
1	In use of your maximum	Money at work against your maximum amount.
2	Loss so far of your lock	Your real-money loss against your loss lock.
3	Change limits	New limits. The loss keeps counting from the same moment.
4	Support	Questions? Write to us.

- Your loss count starts when you first switch Real money on. New limits, or switching off and on again, do not reset it.
- You can switch to **Off** at any time. The app then places no order and sells nothing: your positions stay open on Binance with their stop-loss and take-profit orders.

- To go back to Paper, save your testnet keys again first: Paper cannot use your trade-only key. In Paper and in Manual mode the app no longer sees your real account. Check your positions and their stop-loss orders on Binance.

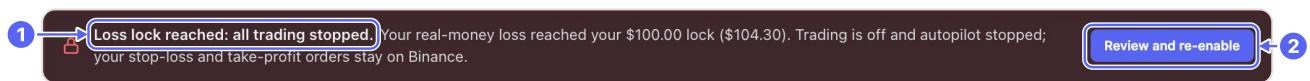

If Real money switches off by itself

The app switches Real money to **Off** when your key or your country no longer passes its safety check: for example, a permission is added to your key. The Trading mode card says what failed. We email you, and with Telegram alerts connected you get a message (chapter 4).

Saving or removing Binance keys also switches it off: the app must check a new key first.

Each time, the app sells nothing and your positions stay open on Binance with their orders. Autopilot keeps analyzing and places no order. Fix the cause, then switch Real money on again.

If the loss lock is reached

The loss lock banner.

#	NAME	WHAT IT DOES
1	Loss lock reached	Trading and autopilot are off. Nothing is sold: your positions and their orders stay on Binance.
2	Review and re-enable	Only if you decide to: new limits, the disclaimer again and a new loss count.

All trading and autopilot stop. The app sells nothing: your positions stay open on Binance with their stop-loss and take-profit orders, so the loss can still grow. We email you, and with Telegram alerts connected you get a message. Read your decision journal before you press **Review and re-enable**.

Next: chapter 9, habits that keep you in control. Chapter 8 is Manual mode.

CHAPTER 08

Manual mode: by hand on any exchange

The AI gives you each trade. You place it yourself on any exchange and press Done. No exchange keys.

08

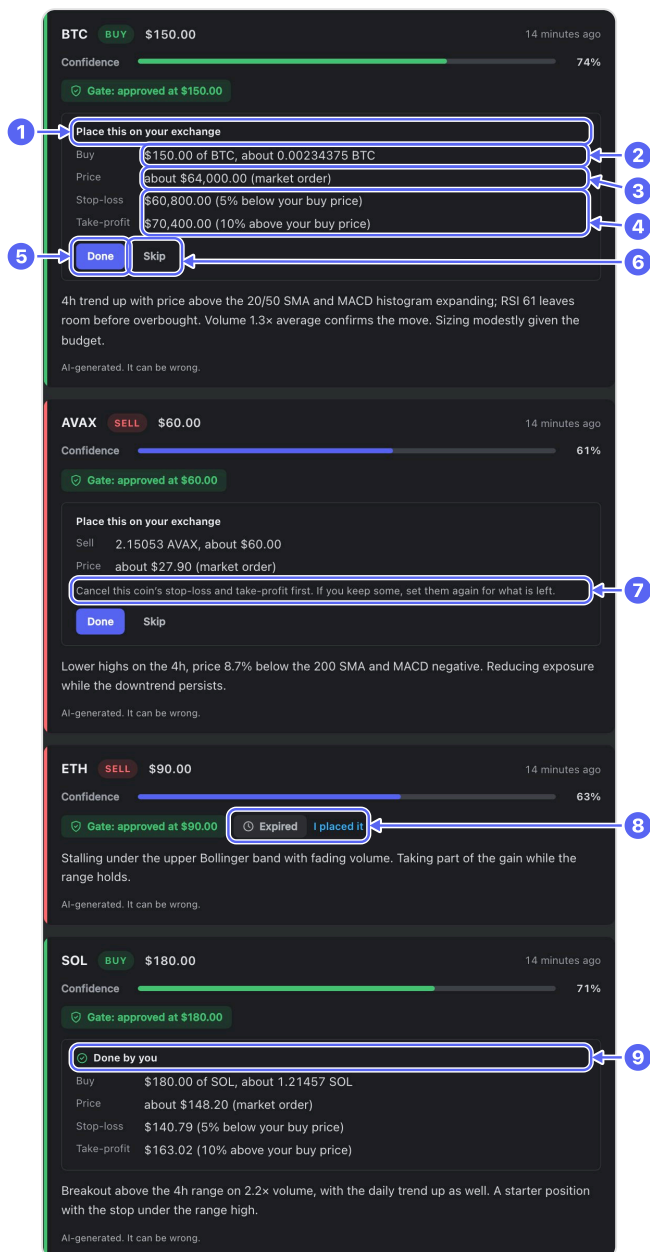

In Manual mode the app places no order: you place each trade by hand on any exchange. The risk gate works as in every other mode.

Switch to Manual mode

On the **Trading mode** card in Settings, pick **Manual** and press **Switch to Manual** (chapter 4). Coins and prices come from Binance's public data, so put only coins on your watchlist that your own exchange lists. Then run an analysis or start autopilot, as in chapter 5.

A trade to place

After an analysis, each buy or sell that the risk gate approved has a box on its decision card: **Place this on your exchange**. A banner at the top of the app counts the waiting trades, for example "2 trades to place."

#	NAME	WHAT IT DOES
1	Place this on your exchange	A trade the risk gate approved. You place it by hand.
2	Buy	The approved amount, and about how many coins that is.
3	Price	The market price the AI saw. Your price can differ a little.
4	Stop-loss and take-profit	For you to set on your exchange after the buy. The app cannot set them.
5	Done	Press it after you placed the order (step 4).
6	Skip	You are not placing this one. Nothing is recorded.
7	Before a sell	Cancel that coin's stop-loss and take-profit on your exchange first.
8	Expired	No longer waiting. If you placed it after all, press I placed it.
9	Done by you	A trade you confirmed. Its stop-loss and take-profit stay readable.

Latest analysis in Manual mode: two trades to place, one expired, one done.

1. For a sell, first cancel that coin's stop-loss and take-profit on your exchange.
2. Place the order on your exchange as a market order, for the amount in the box. A market order buys or sells at once, at the current price.
3. After a buy, set a stop-loss and a take-profit on your exchange, at the two prices in the box.
4. Press **Done**, then type the quantity and the price your exchange shows. The price is in US dollars: if your exchange shows another currency, keep the price already in the field.

A buy under \$10.00 is blocked as too small to place by hand. A sell has no minimum.

The buttons

BUTTON	WHAT IT DOES
Skip	You do not place this trade. Nothing is recorded.

BUTTON	WHAT IT DOES
I placed it	On a trade that shows Skipped or Expired, when you placed it after all. It opens the same form as Done.
Sold	On each position. It confirms a sale the app cannot see: a stop-loss or take-profit that filled, or a sale you made yourself.
Undo	In the message that stays for 30 seconds after Done or Sold. It takes that entry back.

TIP

Confirmed a buy by mistake, and the Undo message is gone? Press **Sold** and type the same price.

Your positions and trades

A buy you confirm becomes a position. The **Positions** card then reads **From the trades you confirmed**, and **Recent trades** lists the trades you confirmed. Manual mode keeps its own figures, apart from Paper and Real money.

When a trade expires

A waiting trade shows **Expired** when:

- the next analysis runs,
- you confirm another trade for the same coin, or
- you leave Manual mode.

A waiting buy can also expire when you confirm a trade for another coin, because your limits changed.

So with autopilot, choose an analysis interval that leaves you time to place each trade. The app sends no email about a waiting trade: connect Telegram alerts to hear about one (chapter 4).

WHAT THE APP CANNOT SEE

- The app never places, checks or cancels an order on your exchange. It shows no balances and no open orders, and it cannot set your stop-loss. When a stop-loss or take-profit fills, press **Sold**.
- The caps and the kill switch limit the trades the app gives you, and they count only what you confirm. They cannot stop an order you place on your own.
- Exchange fees count only if you include them in what you type.
- You can confirm a buy up to 110% of the amount in its box. What you buy above that stays outside the app's figures.
- **I placed it** works only while the trade is still listed on your dashboard.

Next: chapter 9, habits that keep you in control.

CHAPTER 09

Good habits

Habits of careful traders. None of them promises profit. All of them help you stay in control.

Learn these six habits in Paper, and keep them when you trade for real.

Practice in Paper first

Give Paper a few weeks. Watch what the AI proposes when the market rises, falls and moves sideways, and how often the risk gate blocks a decision. Trade for real only when Paper no longer surprises you.

Read the decision journal

Open **Earlier decisions** often and read the reasoning, above all for blocked decisions and for trades that lost. Does the reasoning match the numbers on the coin card? Would you have made the same trade?

Change one setting at a time

After a change, wait for several analyses before you judge it. Change the risk level or the stop-loss, not both at once.

Let the risk gate work

A blocked decision is the gate at work. Do not raise your risk level after a bad week. Keep your limits steady, and let the kill switch pause new buys after a loss (chapter 2).

Check your stop-loss orders

In Paper and Real money, look at the **Open orders** tab of the Positions card: every position needs its stop-loss and take-profit. If a red **No stop-loss** box shows, act at once (chapter 5). In Manual mode, check them on your exchange, and press **Sold** when one has filled.

Protect your accounts

Use a strong password that you use nowhere else, and two-step sign-in at your exchange. Never share your password or your keys: we never ask for them. If a key may have leaked, revoke it where you created it and save a new one.

THE ONE RULE

Trade only money you can afford to lose, and treat every analysis as one input to your own judgment, not as advice.

Next: chapter 10 explains every number on a coin card.

Glossary

Every number on a coin card, in plain words. They describe the market. None of them predicts it.

10

A candle is the price movement of one period, for example 1 hour (1h) or 1 day (1d). The app computes every number on closed candles, on two timeframes for each coin.

The formulas are on forecastspro.com/math.

RSI 14 Relative Strength Index, 14 candles

Momentum from 0 to 100: how strong recent rises are against recent falls. A flat market reads 50. Above 70 is called overbought (shown in amber), below 30 oversold. The card labels 55 and up Strong, and 45 and below Weak.

MACD 12 / 26 / 9

Compares a fast and a slow average of the price. The card says Bullish when momentum builds upward, Bearish when downward.

ADX 14 Average Directional Index

How strong a trend is, up or down. From 25 the card says Trending, below that Ranging. Under 20 the market moves sideways.

Volatility ATR 14 as % of price

The typical size of one candle, as a percentage of the price. The card shows five levels, from Very low to Very high. High volatility shows in amber.

Bollinger 20 candles, 2 standard deviations (%B)

Where the price sits inside a band around its 20-candle average: Lower band, Mid-range, Upper band, or outside the band (Above band or Below band, in amber).

Volume ratio to its average

Recent trading volume against its average: 1.0x is normal, 1.3x and more is busier than usual (green).

Next: chapter 11, quick answers and how to reach us.

Fear & Greed 0 to 100

The mood of the crypto market: 0 is extreme fear, 100 extreme greed. The AI reads it as background.

Trend: 4h, 1d and others two timeframes

Up: the price is above its 50-candle average, and that average is above the 200-candle average. Down: the reverse. Sideways: anything else. Each coin gets a label on its trading timeframe and on the next one up (chapter 4).

200 SMA distance from the 200-candle average

How far the price is above (positive) or below (negative) its 200-candle average, in percent.

7d, and the change next to the price

Two price changes, both counted in candles: the last 168 candles and the last 24. On 1h candles that is 7 days and 24 hours. On 4h candles it is 28 days and 4 days, on daily candles 168 days and 24 days.

Confidence

The AI's own certainty about a decision (chapter 5).

Realized and unrealized P&L

Realized: the profit or loss of closed trades, at average cost and after fees. Unrealized: what open positions would make or lose at the price now.

Questions and help

Quick answers to what customers ask most, and real people by email.

11

Find your question. Each answer names the chapter that tells you more.

Troubleshooting and questions

Run analysis looks greyed out.

Press it, and it says what is missing: your AI key is not saved, the provider rejected it, or your watchlist is empty (chapter 4).

The analysis did not complete.

The Latest analysis card shows the reason in red. Often the AI key has no credit left, or the provider did not answer. Try again in a few minutes.

A key shows Invalid or Error.

Invalid means the service rejected the key: copy it again, whole, and check its kind (testnet keys for Paper). A trade-only Binance key shows Invalid before your first switch to Real money (chapter 7). **Error** means the service did not answer: press **Test connections** again later.

A coin will not add to my watchlist.

Type only the ticker, for example BTC. The coin must trade against USDT on Binance, and a full watchlist takes no more coins (chapter 4).

Every decision is a hold, or buys keep being blocked.

Read the gate's reason on the card. A confidence block means the market is unclear. A cap block means your budget is already at work (chapter 5).

I am in Paper but no trades appear.

Check that your testnet keys are saved and show **Connected**, and that an analysis ran. A hold or a blocked decision places no order (chapter 5).

I see a red "No stop-loss" box.

A position may have no stop-loss on Binance. Follow chapter 5.

Does it work with my exchange?

Automatic trading is on Binance only. In Manual mode you place every order by hand on any exchange (chapter 8). No Binance account? Paper needs only a free testnet key.

A waiting trade shows Expired.

A newer analysis or a newer trade replaced it. If you placed it after all, press **I placed it** (chapter 8).

My Telegram alerts stopped.

A password change or reset turns them off. Connect again on the Telegram alerts card in Settings (chapter 4).

Real money is locked.

The Trading mode card in Settings lists every safety check and what is missing (chapter 7).

The loss lock was reached.

All trading stopped and we emailed you. Nothing was sold: your positions and their orders stay on Binance. Read your decision journal first, then see chapter 7.

I forgot my password.

Open **Forgot password?** on the sign-in page. The reset link goes to your account's email address, and a reset signs out your other sessions.

How do I change my country or my email address?

Email support from your account's address. You can fix a typo in a new, unconfirmed address yourself, on the Account page (chapter 3).

Getting help

Write to support@forecastspro.com from your account's email address. We answer every support email within 48 hours.

- Say what you did and what you expected. A screenshot helps.
- For a payment, add the order ID: **Copy order ID** on the Billing page.
- Never send your password or your API keys. We never ask for them.

More answers are on forecastspro.com: [How it works](#), [Safety](#), [The math](#) and the [FAQ](#). The Terms, the Privacy Policy and the Risk Disclosure are linked at the bottom of every page of forecastspro.com.

You are ready.

Practice in Paper first, read the reasoning, keep your limits steady and let the risk gate do its work.

ForecastsPro is software, not financial advice. Its analysis is AI-generated and can be wrong, and no profit is promised. Crypto assets are volatile: you can lose some or all of the money you trade. Screenshots show sample data from a preview account, not real trading results.
